HEWLETT PACKARD

High CMR, High Speed Optocouplers

Technical Data

HCPL-4504
HCPL-J454
HCPL-0454
HCNW4504

Features

- **Short Propagation Delays for TTL and IPM Applications**
- **15 kV/μs Minimum Common Mode Transient Immunity at V_{CM} = 1500 V for TTL/Load Drive**
- **High CTR at T_A = 25°C**
  >25% for HCPL-4504/0454
  >23% for HCNW4504
  >19% for HCPL-J454
- **Electrical Specifications for Common IPM Applications**
- **TTL Compatible**
- **Guaranteed Performance from 0°C to 70°C**
- **Open Collector Output**
- **Safety Approval**
  UL Recognized
  - 2500 V rms / 1min. for HCPL-4504/0454
  - 3750 V rms / 1min. for HCPL-J454
  - 5000 V rms / 1min. for HCPL-4504 Option020 and HCNW4504

  CSA Approved
  BSI Certified (HCNW4504)
  VDE0884 Approved
  - V_{IORM} = 560 Vpeak for HCPL-0454 Option060
  - V_{IORM} = 630 Vpeak for HCPL-4504 Option060
  - V_{IORM} = 891 Vpeak for HCPL-J454
  - V_{IORM} = 1414 Vpeak for HCNW4504

Applications

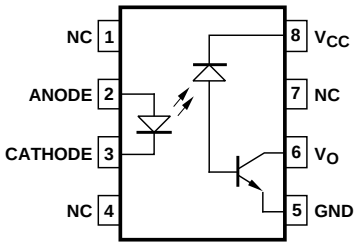
- **Inverter Circuits and Intelligent Power Module (IPM) interfacing -**
  High Common Mode Transient Immunity (> 10 kV/μs for an IPM load/drive) and (t_{PLH} - t_{PHL}) Specified (See Power Inverter Dead Time section)
- **Line Receivers -**
  Short Propagation Delays and Low Input-Output Capacitance
- **High Speed Logic Ground Isolation - TTL/TTL, TTL/CMOS, TTL/LSTTL**
- **Replaces Pulse Transformers -**
  Save Board Space and Weight
- **Analog Signal Ground Isolation -**
  Integrated Photodetector Provides Improved Linearity over Phototransistors

Description

The HCPL-4504 and HCPL-0454 contain a GaAsP LED while the HCPL-J454 and HCNW4504 contain an AlGaAs LED. The LED is optically coupled to an integrated high gain photo detector.

The HCPL-4504 series has short propagation delays and high CTR. The HCPL-4504 series also has a guaranteed propagation delay difference (t_{PLH}-t_{PHL}). These

Functional Diagram



TRUTH TABLE

LED	V_O
ON	LOW
OFF	HIGH

A 0.1 μF bypass capacitor between pins 5 and 8 is recommended.

CAUTION: It is advised that normal static precautions be taken in handling and assembly of this component to prevent damage and/or degradation which may be induced by ESD.

features make the HCPL-4504 series an excellent solution to IPM inverter dead time and other switching problems. The CTR, propagation delay, and CMR are specified both for TTL and IPM conditions which are provided for ease of application. These single channel, diode-transistor opto-couplers are available in 8-Pin DIP, SO-8, and Widebody package configurations. An insulating layer between a LED and an integrated photodetector provide electrical insulation between input and output. Separate connections for the photodiode bias and output-transistor collector increase the speed up to a hundred times that of a conventional phototransistor coupler by reducing the base collector capacitance.

Selection Guide

Package Type	Standard 8-Pin DIP (300 Mil)	White Mold 8-Pin DIP (300 Mil)	Small Outline SO8	Widebody (400 Mil)
Part Number	HCPL-4504	HCPL-J454	HCPL-0454	HCNW4504
VDE0884 Approval	V_{IORM} = 630 Vpeak (Option 060)	V_{IORM} = 891 Vpeak	V_{IORM} = 560 Vpeak (Option 060)	V_{IORM} = 1414 Vpeak

Ordering Information

Specify Part number followed by Option Number (if desired)

Example

HCPL-4504 #XXX

- 020 = UL 5000 Vrms/1minute Option* for HCPL-4504 Only.
- 060 = VDE0884 Option* for HCPL-4504/0454.
- 300 = Gull-Wing Lead Option for HCPL-4504/J454, HCNW4504.
- 500 = Tape and Reel Packaging Option.

Option data sheets available. Contact Hewlett-Packard sales representative or authorized distributor for information.

*Combination of Option 020 and Option 060 is not available.

Insulation and Safety Related Specifications

Parameter	Symbol	Value				Units	Conditions
		HCPL-4504	HCPL-J454	HCPL-0454	HCNW4504		
Minimum External Air Gap (External Clearance)	L(101)	7.1	7.4	4.9	9.6	mm	Measured from input terminals to output terminals, shortest distance through air.
Minimum External Tracking (External Creepage)	L(102)	7.4	8.0	4.8	10.0	mm	Measured from input terminals to output terminals, shortest distance path along body.
Minimum Internal Plastic Gap (Internal Clearance)		0.08	0.5	0.08	1.0	mm	Through insulation distance, conductor to conductor, usually the direct distance between the photoemitter and photodetector inside the optocoupler cavity.
Minimum Internal Tracking (Internal Creepage)		NA	NA	NA	4.0	mm	Measured from input terminals to output terminals, along internal cavity.
Tracking Resistance (Comparative Tracking Index)	CTI	≥ 175	≥ 175	≥ 175	≥ 200	Volts	DIN IEC 112/VDE 0303 Part 1
Isolation Group		IIIa	IIIa	IIIa	IIIa		Material Group (DIN VDE 0110, 1/89, Table 1)

All Hewlett-Packard data sheets report the creepage and clearance inherent to the optocoupler component itself. These dimensions are needed as a starting point for the equipment designer when determining the circuit insulation requirements.

However, once mounted on a printed circuit board, minimum creepage and clearance requirements must be met as specified for individual equipment standards. For creepage, the shortest distance path along the surface of a printed circuit board between the solder fillets of the input and output leads must be considered. There are recommended techniques such as grooves and ribs which may be used on a printed circuit board to achieve desired creepage and clearances. Creepage and clearance distances will also change depending on factors such as pollution degree and insulation level.

†The Input-Output Momentary Withstand Voltage is a dielectric voltage rating that should not be interpreted as an input-output continuous voltage rating. For the continuous voltage rating refer to the VDE 0884 Insulation Related Characteristics Table (if applicable), your equipment level safety specification or HP Application Note 1074 entitled "Optocoupler Input-Output Endurance Voltage."

Notes:

1. Derate linearly above 70°C free-air temperature at a rate of 0.8 mA/°C (8-Pin DIP). Derate linearly above 85°C free-air temperature at a rate of 0.5 mA/°C (SO-8).
2. Derate linearly above 70°C free-air temperature at a rate of 1.6 mA/°C (8-Pin DIP). Derate linearly above 85°C free-air temperature at a rate of 1.0 mA/°C (SO-8).
3. Derate linearly above 70°C free-air temperature at a rate of 0.9 mW/°C (8-Pin DIP). Derate linearly above 85°C free-air temperature at a rate of 1.1 mW/°C (SO-8).
4. Derate linearly above 70°C free-air temperature at a rate of 2.0 mW/°C (8-Pin DIP). Derate linearly above 85°C free-air temperature at a rate of 2.3 mW/°C (SO-8).
5. CURRENT TRANSFER RATIO in percent is defined as the ratio of output collector current, I_O, to the forward LED input current, I_F, times 100.
6. Device considered a two-terminal device: Pins 1, 2, 3, and 4 shorted together and Pins 5, 6, 7, and 8 shorted together.
7. Under TTL load and drive conditions: Common mode transient immunity in a Logic High level is the maximum tolerable (positive) dV_{CM}/dt on the leading edge of the common mode pulse, V_{CM}, to assure that the output will remain in a Logic High state (i.e., V_O > 2.0 V). Common mode transient immunity in a Logic Low level is the maximum tolerable (negative) dV_{CM}/dt on the trailing edge of the common mode pulse signal, V_{CM}, to assure that the output will remain in a Logic Low state (i.e., V_O < 0.8 V).
8. Under IPM (Intelligent Power Module) load and LED drive conditions: Common mode transient immunity in a Logic High level is the maximum tolerable dV_{CM}/dt on the leading edge of the common mode pulse, V_{CM}, to assure that the output will remain in a Logic High state (i.e., V_O > 3.0 V). Common mode transient immunity in a Logic Low level is the maximum tolerable dV_{CM}/dt on the trailing edge of the common mode pulse signal, V_{CM}, to assure that the output will remain in a Logic Low state (i.e., V_O < 1.0 V).
9. The 1.9 kΩ load represents 1 TTL unit load of 1.6 mA and the 5.6 kΩ pull-up resistor.
10. The R_L = 20 kΩ, C_L = 100 pF load represents an IPM (Intelligent Power Module) load.
11. See Option 020 data sheet for more information.
12. Use of a 0.1 µF bypass capacitor connected between Pins 5 and 8 is recommended.
13. In accordance with UL 1577, each optocoupler is proof tested by applying an insulation test voltage ≥ 3000 V rms for 1 second (leakage detection current limit, I_{i-o} ≤ 5 µA).
14. In accordance with UL 1577, each optocoupler is proof tested by applying an insulation test voltage ≥ 4500 V rms for 1 second (leakage detection current limit, I_{i-o} ≤ 5 µA).
15. In accordance with UL 1577, each optocoupler is proof tested by applying an insulation test voltage ≥ 6000 V rms for 1 second (leakage detection current limit, I_{i-o} ≤ 5 µA).
16. This test is performed before the 100% Production test shown in the VDE 0884 Insulation Related Characteristics Table, if applicable.
17. The difference between t_{PLH} and t_{PHL} between any two devices (same part number) under the same test condition. (See Power Inverter Dead Time and Propagation Delay Specifications section.)

Power Inverter Dead Time and Propagation Delay Specifications

The HCPL-4504/0454/J454 and HCNW4504 include a specification intended to help designers minimize "dead time" in their power inverter designs. The new "propagation delay difference" specification (t_{PLH} - t_{PHL}) is useful for determining not only how much optocoupler switching delay is needed to prevent "shoot-through" current, but also for determining the best achievable worst-case dead time for a given design.

When inverter power transistors switch (Q1 and Q2 in Figure 17), it is essential that they never conduct at the same time. Extremely large currents will flow if there is any overlap in their conduction during switching transitions, potentially damaging the transistors and even the surrounding circuitry. This "shoot-through" current is eliminated by delaying the turn-on of one transistor (Q2) long enough to ensure that the opposing transistor (Q1) has completely turned off. This delay introduces a small amount of "dead time" at the output of the inverter during which both transistors are off during switching transitions. Minimizing this dead time is an important design goal for an inverter designer.

The amount of turn-on delay needed depends on the propagation delay characteristics of the optocoupler, as well as the characteristics of the transistor base/gate drive circuit. Considering only the delay characteristics of the optocoupler (the characteristics of the base/gate drive circuit can be analyzed in the

same way), it is important to know the minimum and maximum turn-on (t_{PHL}) and turnoff (t_{PLH}) propagation delay specifications, preferably over the desired operating temperature range. The importance of these specifications is illustrated in Figure 17. The waveforms labeled "LED1", "LED2", "OUT1", and "OUT2" are the input and output voltages of the optocoupler circuits driving Q1 and Q2 respectively. Most inverters are designed such that the power transistor turns on when the optocoupler LED turns on; this ensures that both power transistors will be off in the event of a power loss in the control circuit. Inverters can also be designed such that the power transistor turns off when the optocoupler LED turns on; this type of design, however, requires additional fail-safe circuitry to turn off the power transistor if an over-current condition is detected. The timing illustrated in Figure 17 assumes that the power transistor turns on when the optocoupler LED turns on.

The LED signal to turn on Q2 should be delayed enough so that an optocoupler with the very fastest turn-on propagation delay (t_{PHLmin}) will never turn on before an optocoupler with the very slowest turn-off propagation delay (t_{PLHmax}) turns off. To ensure this, the turn-on of the optocoupler should be delayed by an amount no less than ($t_{PLHmax} - t_{PHLmin}$), which also happens to be the maximum data sheet value for the propagation delay difference specification, ($t_{PLH} - t_{PHL}$). The HCPL-4504/0454/J454 and HCNW4504 specify a maximum ($t_{PLH} - t_{PHL}$) of 1.3 µs over an operating temperature range of 0-70°C.

Although $(t_{PLH}-t_{PHL})_{max}$ tells the designer how much delay is needed to prevent shoot-through current, it is insufficient to tell the designer how much dead time a design will have. Assuming that the optocoupler turn-on delay is exactly equal to $(t_{PLH} - t_{PHL})_{max}$, the minimum dead time is zero (i.e., there is zero time between the turnoff of the very slowest optocoupler and the turn-on of the very fastest optocoupler).

Calculating the maximum dead time is slightly more complicated. Assuming that the LED turn-on delay is still exactly equal to $(t_{PLH} - t_{PHL})_{max}$, it can be seen in Figure 17 that the maximum dead time is the sum of the maximum difference in turn-on delay plus the maximum difference in turnoff delay,

$$[(t_{PLHmax}-t_{PLHmin})+(t_{PHLmax}-t_{PHLmin})].$$

This expression can be rearranged to obtain

$$[(t_{PLHmax}-t_{PHLmin})-(t_{PHLmin}-t_{PHLmax})],$$

and further rearranged to obtain

$$[(t_{PLH}-t_{PHL})_{max}-(t_{PLH}-t_{PHL})_{min}],$$

which is the maximum minus the minimum data sheet values of ($t_{PLH}-t_{PHL}$). The difference between the maximum and minimum values depends directly on the total spread in propagation delays and sets the limit on how good the worst-case dead time can be for a given design. Therefore, optocouplers with tight propagation delay specifications (and not just shorter delays or lower pulse-width distortion) can achieve short dead times in power inverters. The HCPL-4504/0454/J454 and HCNW4504 specify a minimum ($t_{PLH} - t_{PHL}$) of -0.7 µs over an operating temperature range of 0-70°C, resulting in a maximum dead time of 2.0 µs when the LED turn-on delay is equal to $(t_{PLH}-t_{PHL})_{max}$, or 1.3 µs.

It is important to maintain accurate LED turn-on delays because delays shorter than $(t_{PLH} - t_{PHL})_{max}$ may allow shoot-through currents, while longer delays will increase the worst-case dead time.
