# 2.0 Amp Output Current IGBT Gate Drive Optocoupler 

## Technical Data

## Features

- 2.0 A Minimum Peak Output Current
- 15 kV/ $\mu$ s Minimum Common Mode Rejection (CMR) at $V_{\mathrm{CM}}=1500 \mathrm{~V}$
- 0.5 V Maximum Low Level Output Voltage ( $\mathrm{V}_{\mathrm{OL}}$ )
Eliminates Need for Negative Gate Drive
- $I_{C C}=5 \mathrm{~mA}$ Maximum Supply Current
- Under Voltage Lock-Out Protection (UVLO) with Hysteresis
- Wide Operating $V_{\text {CC }}$ Range: 15 to 30 Volts
- 500 ns Maximum Switching Speeds
- Industrial Temperature

Range: $-40^{\circ} \mathrm{C}$ to $100^{\circ} \mathrm{C}$

- Safety Approval UL Recognized
3750 Vrms for 1 min . for HCPL-3120/J312
5000 Vrms for 1 min . for HCNW3120

CSA Approval
IEC/EN/DIN EN 60747-5-2
Approved
$\mathrm{V}_{\text {IORM }}=630$ Vpeak for
HCPL-3120 (Option 060)
$\mathrm{V}_{\text {IORM }}=891$ Vpeak for
HCPL-J312
$\mathrm{V}_{\text {IORM }}=1414$ Vpeak for HCNW3120

HCPL-3120
HCPL-J312
HCNW3120

## Functional Diagram

## Applications

- IGBT/MOSFET Gate Drive
- AC/Brushless DC Motor Drives
- Industrial Inverters
- Switch Mode Power Supplies

TRUTH TABLE

| ON | $13.5-30 \mathrm{~V}$ | $12-30 \mathrm{~V}$ | HIGH |

A $0.1 \mu F$ bypass capacitor must be connected between pins 5 and 8 .

## Description

The HCPL-3120 contains a GaAsP LED while the HCPL-J312 and the HCNW3120 contain an AlGaAs LED. The LED is optically coupled to an integrated circuit with a power output stage. These optocouplers are ideally suited for driving power IGBTs and MOSFETs used in motor control inverter applications. The high
operating voltage range of the output stage provides the drive voltages required by gate controlled devices. The voltage and current supplied by these optocouplers make them ideally suited for directly driving IGBTs with ratings up to $1200 \mathrm{~V} / 100 \mathrm{~A}$. For IGBTs with higher ratings, the HCPL-3120 series can be used to drive a discrete power
stage which drives the IGBT gate. The HCNW3120 has the highest insulation voltage of $\mathrm{V}_{\text {IORM }}=1414$ Vpeak in the IEC/ EN/DIN EN 60747-5-2. The HCPL-J312 has an insulation voltage of $\mathrm{V}_{\text {IORM }}=891$ Vpeak and the $\mathrm{V}_{\text {IORM }}=630$ Vpeak is also available with the HCPL3120 (Option 060).

## Selection Guide

| Part Number | HCPL-3120 | HCPL-J312 | HCNW3120 | HCPL-3150* |
| :--- | :---: | :---: | :---: | :---: |
| Output Peak Current ( IO) | 2.0 A | 2.0 A | 2.0 A | 0.5 A |
| IEC/EN/DIN EN <br> $60747-5-2 ~ A p p r o v a l ~$ | $\mathrm{V}_{\text {IORM }}=630$ Vpeak <br> (Option 060) | $\mathrm{V}_{\text {IORM }}=891$ Vpeak | $\mathrm{V}_{\text {IORM }}=1414$ Vpeak | $\mathrm{V}_{\text {IORM }}=630$ Vpeak <br> (Option 060) |

*The HCPL-3150 Data sheet available. Contact Agilent sales representative or authorized distributor.

## Ordering Information

Specify Part Number followed by Option Number (if desired)
Example:

$$
\begin{aligned}
& \text { HCPL-3120\#XXXX }
\end{aligned}
$$

Option 500 contains 1000 units (HCPL-3120/J312), 750 units (HCNW3120) per reel. Other options contain 50 units (HCPL-3120/J312), 42 units (HCNW312) per tube. Option data sheets available. Contact Agilent sales representative or authorized distributor.

Remarks: The notation "\#" is used for existing products, while (new) products launched since 15th July 2001 and lead free option will use "-"

## Package Outline Drawings

## Insulation and Safety Related Specifications

|  |  | Value |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :--- |
| PCPL- | HCPL- <br> J312 | HCNW <br> $\mathbf{3 1 2 0}$ | Units |  |  |  |
| Minimum External <br> Air Gap (Clearance) | Lymbol | L(101) | 7.1 | 7.4 | 9.6 | mm |
| Measured from input terminals to <br> output terminals, shortest distance <br> through air. |  |  |  |  |  |  |
| Minimum External <br> Tracking (Creepage) | L(102) | 7.4 | 8.0 | 10.0 | mm | Measured from input terminals to <br> output terminals, shortest distance <br> path along body. |
| Minimum Internal <br> Plastic Gap <br> (Internal Clearance) |  | 0.08 | 0.5 | 1.0 | mm | Insulation thickness between emitter <br> and detector; also known as distance <br> through insulation. |
| Tracking Resistance <br> (Comparative <br> Tracking Index) | CTI | $>175$ | $>175$ | $>200$ | Volts | DIN IEC 112/VDE 0303 Part 1 |
| Isolation Group |  | IIIa | IIIa | IIIa |  | Material Group (DIN VDE 0110, 1/89, <br> Table 1) |

All Agilent data sheets report the creepage and clearance inherent to the optocoupler component itself. These dimensions are needed as a starting point for the equipment designer when determining the circuit insulation requirements. However, once mounted on a printed circuit
board, minimum creepage and clearance requirements must be met as specified for individual equipment standards. For creepage, the shortest distance path along the surface of a printed circuit board between the solder fillets of the input and output leads must be considered. There
are recommended techniques such as grooves and ribs which may be used on a printed circuit board to achieve desired creepage and clearances. Creepage and clearance distances will also change depending on factors such as pollution degree and insulation level.

**The Input-Output Momentary Withstand Voltage is a dielectric voltage rating that should not be interpreted as an input-output continuous voltage rating. For the continuous voltage rating refer to your equipment level safety specification or Agilent Application Note 1074 entitled "Optocoupler Input-Output Endurance Voltage."

## Notes:

1. Derate linearly above $70^{\circ} \mathrm{C}$ free-air temperature at a rate of $0.3 \mathrm{~mA} /{ }^{\circ} \mathrm{C}$.
2. Maximum pulse width $=10 \mu \mathrm{~s}$, maximum duty cycle $=0.2 \%$. This value is intended to allow for component tolerances for designs with $\mathrm{I}_{\mathrm{O}}$ peak minimum $=2.0 \mathrm{~A}$. See Applications section for additional details on limiting $\mathrm{I}_{\mathrm{OH}}$ peak.
3. Derate linearly above $70^{\circ} \mathrm{C}$ free-air temperature at a rate of $4.8 \mathrm{~mW} /{ }^{\circ} \mathrm{C}$.
4. Derate linearly above $70^{\circ} \mathrm{C}$ free-air temperature at a rate of $5.4 \mathrm{~mW} /{ }^{\circ} \mathrm{C}$. The maximum LED junction temperature should not exceed $125^{\circ} \mathrm{C}$.
5. Maximum pulse width $=50 \mu \mathrm{~s}$, maximum duty cycle $=0.5 \%$.
6. In this test $\mathrm{V}_{\mathrm{OH}}$ is measured with a dc load current. When driving capacitive loads $\mathrm{V}_{\mathrm{OH}}$ will approach $\mathrm{V}_{\mathrm{CC}}$ as $\mathrm{I}_{\mathrm{OH}}$ approaches zero amps.
7. Maximum pulse width $=1 \mathrm{~ms}$, maximum duty cycle $=20 \%$.
8. In accordance with UL1577, each optocoupler is proof tested by applying an insulation test voltage $\geq 4500$ Vrms for 1 second (leakage detection current limit, $\mathrm{I}_{\mathrm{I}-\mathrm{O}} \leq 5 \mu \mathrm{~A}$ ).
9. In accordance with UL1577, each optocoupler is proof tested by applying an insulation test voltage $\geq 4500$ Vrms for 1 second (leakage detection current limit, $\mathrm{I}_{\mathrm{I}-\mathrm{O}} \leq 5 \mu \mathrm{~A}$ ).
10. In accordance with UL1577, each optocoupler is proof tested by applying an insulation test voltage $\geq 6000$ Vrms for 1 second (leakage detection current limit, $\mathrm{I}_{\mathrm{I}-\mathrm{O}} \leq 5 \mu \mathrm{~A}$ ).
11. Device considered a two-terminal device: pins $1,2,3$, and 4 shorted together and pins $5,6,7$, and 8 shorted together.
12. The difference between $t_{\text {PHL }}$ and $t_{\text {PLH }}$ between any two HCPL-3120 parts under the same test condition.
13. Pins 1 and 4 need to be connected to LED common.
14. Common mode transient immunity in the high state is the maximum tolerable $\mathrm{dV}_{\mathrm{CM}} / \mathrm{dt}$ of the common mode pulse, $\mathrm{V}_{\mathrm{CM}}$, to assure that the output will remain in the high state (i.e., $\mathrm{V}_{\mathrm{O}}>15.0 \mathrm{~V}$ ).
15. Common mode transient immunity in a low state is the maximum tolerable $\mathrm{dV}_{\mathrm{CM}} / \mathrm{dt}$ of the common mode pulse, $\mathrm{V}_{\mathrm{CM}}$, to assure that the output will remain in a low state (i.e., $\mathrm{V}_{\mathrm{O}}<1.0 \mathrm{~V}$ ).
16. This load condition approximates the gate load of a $1200 \mathrm{~V} / 75 \mathrm{~A}$ IGBT.
17. Pulse Width Distortion (PWD) is defined as $\left|\mathrm{t}_{\mathrm{PHL}}{ }^{-\mathrm{t}_{\mathrm{PLH}}}\right|$ for any given device.

## Applications Information

 Eliminating Negative IGBT Gate Drive (Discussion applies to HCPL-3120, HCPL-J312, and HCNW3120)To keep the IGBT firmly off, the HCPL-3120 has a very low maximum $V_{\mathrm{OL}}$ specification of 0.5 V. The HCPL-3120 realizes this very low $\mathrm{V}_{\mathrm{OL}}$ by using a DMOS transistor with $1 \Omega$ (typical) on resistance in its pull down circuit. When the HCPL-

3120 is in the low state, the IGBT gate is shorted to the emitter by $\mathrm{Rg}+1 \Omega$. Minimizing Rg and the lead inductance from the HCPL3120 to the IGBT gate and emitter (possibly by mounting the HCPL-3120 on a small PC board directly above the IGBT) can eliminate the need for negative IGBT gate drive in many applications as shown in Figure 25. Care should be taken with such a PC board design to avoid routing the

IGBT collector or emitter traces close to the HCPL-3120 input as this can result in unwanted coupling of transient signals into the HCPL-3120 and degrade performance. (If the IGBT drain must be routed near the HCPL3120 input, then the LED should be reverse-biased when in the off state, to prevent the transient signals coupled from the IGBT drain from turning on the HCPL-3120.)

Figure 25. Recommended LED Drive and Application Circuit.

Selecting the Gate Resistor ( Rg ) to Minimize IGBT
Switching Losses. (Discussion applies to HCPL-3120, HCPLJ312 and HCNW3120)
Step 1: Calculate Rg Minimum from the $I_{\text {OL }}$ Peak Specification. The IGBT and Rg in Figure 26 can be analyzed as a simple RC circuit with a voltage supplied by the HCPL-3120.

$$
\begin{aligned}
R g & \geq \frac{\left(V_{C C}-V_{E E}-V_{O L}\right)}{I_{O L P E A K}} \\
& =\frac{\left(V_{C C}-V_{E E}-2 V\right.}{I_{O L P E A K}} \\
& =\frac{(15 V+5 \mathrm{~V}-2 \mathrm{~V})}{2.5 A} \\
& =7.2 \Omega \cong 8 \Omega
\end{aligned}
$$

The $V_{\text {OL }}$ value of 2 V in the previous equation is a conservative value of $V_{O L}$ at the peak current of 2.5A (see Figure 6). At lower Rg values the voltage supplied by the HCPL-3120 is not an ideal voltage step. This results in lower peak currents (more margin) than predicted by this analysis. When negative gate drive is not used $V_{E E}$ in the previous equation is equal to zero volts.

Figure 26. HCPL-3120 Typical Application Circuit with Negative IGBT Gate Drive.

Step 2: Check the HCPL-3120 Power Dissipation and Increase Rg if Necessary. The HCPL-3120 total power dissipation $\left(\mathrm{P}_{\mathrm{T}}\right)$ is equal to the sum of the emitter power $\left(\mathrm{P}_{\mathrm{E}}\right)$ and the output power $\left(\mathrm{P}_{\mathrm{O}}\right)$ :
$P_{T}=P_{E}+P_{O}$
$P_{E}=I_{F} \cdot V_{F} \cdot$ Duty Cycle
$P_{O}=P_{O(B I A S)}+P_{O(S W I T C H I N G)}$

$$
\begin{aligned}
=I_{C C} & \left(V_{C C}-V_{E E}\right) \\
& +E_{S W}\left(R_{G}, Q_{G}\right) \cdot f
\end{aligned}
$$

For the circuit in Figure 26 with $I_{F}$ (worst case) $=16 \mathrm{~mA}, \mathrm{Rg}=8 \Omega$, Max Duty Cycle $=80 \%, \mathrm{Qg}=500 \mathrm{nC}$, $\mathrm{f}=20 \mathrm{kHz}$ and $\mathrm{T}_{\mathrm{A}} \max =85 \mathrm{C}$ :
$P_{E}=16 m A \cdot 1.8 V \cdot 0.8=23 m W$

$$
\begin{aligned}
P_{O}= & 4.25 m A \cdot 20 V \\
& +5.2 \mu J \cdot 20 \mathrm{kHz} \\
= & 85 \mathrm{~mW}+104 \mathrm{~mW} \\
= & 189 \mathrm{~mW} \\
& >178 \mathrm{~mW}\left(P_{O(M A X)} @ 85 C\right. \\
& \left.=250 \mathrm{~mW}-15 C^{*} 4.8 \mathrm{~mW} / \mathrm{C}\right)
\end{aligned}
$$

The value of 4.25 mA for $\mathrm{I}_{\mathrm{CC}}$ in the previous equation was obtained by derating the $\mathrm{I}_{\mathrm{CC}} \max$ of 5 mA (which occurs at $-40^{\circ} \mathrm{C}$ ) to $\mathrm{I}_{\mathrm{CC}} \max$ at 85C (see Figure 7).

Since $P_{0}$ for this case is greater than $\mathrm{P}_{\mathrm{O}(\mathrm{MAX})}$, Rg must be increased to reduce the HCPL-3120 power dissipation.

$$
\begin{aligned}
& P_{O(S W I T C H I N G ~ M A X)} \\
& \quad=P_{O(M A X)}-P_{O(B I A S)} \\
& \quad=178 \mathrm{~mW}-85 \mathrm{~mW} \\
& \quad=93 \mathrm{~mW} \\
& E_{\text {SW(MAX) }}= \\
& \quad=\frac{P_{O(S W I T C H I N G M A X)}}{f} \\
& \quad=\frac{93 \mathrm{~mW}}{20 \mathrm{kHz}}=4.65 \mu \mathrm{~W}
\end{aligned}
$$

For $\mathrm{Qg}=500 \mathrm{nC}$, from Figure 27, a value of $\mathrm{E}_{\mathrm{SW}}=4.65 \mu \mathrm{~W}$ gives a $R g=10.3 \Omega$.

## Thermal Model <br> (Discussion applies to HCPL-3120, HCPL-J312 and HCNW3120)

The steady state thermal model for the HCPL-3120 is shown in Figure 28. The thermal resistance values given in this model can be used to calculate the temperatures at each node for a given operating condition. As shown by the model, all heat generated flows through $\theta_{\mathrm{CA}}$ which raises the case temperature $\mathrm{T}_{\mathrm{C}}$ accordingly. The value of $\theta_{\mathrm{CA}}$ depends on the conditions of the board design and is, therefore, determined by the designer. The value of $\theta_{\mathrm{CA}}=83^{\circ} \mathrm{C} / \mathrm{W}$ was obtained from thermal measurements using a $2.5 \times 2.5$ inch PC
board, with small traces (no ground plane), a single HCPL3120 soldered into the center of the board and still air. The absolute maximum power dissipation derating specifications assume a $\theta_{\mathrm{CA}}$ value of $83^{\circ} \mathrm{C} / \mathrm{W}$.

From the thermal mode in Figure 28 the LED and detector IC junction temperatures can be expressed as:

$$
\begin{aligned}
& T_{J E}=\mathrm{P}_{E} \cdot\left(\theta_{L C} \|\left(\theta_{L D}+\theta_{D C}\right)+\theta_{C A}\right) \\
& \mp P_{A} \cdot\left(\frac{\theta_{L C} * \theta_{D C}}{\theta_{L C}+\theta_{D C}+\theta_{L D}}+\theta_{C A}\right) \\
& T_{J D}=P_{E}\left(\frac{\theta_{L C} \cdot \theta_{D C}}{\theta_{L C}+\theta_{D C}+\theta_{L D}}+\theta_{C A}\right) \\
& +\mathrm{P}_{D} \cdot\left(\theta_{D C} \|\left(\theta_{L D}+\theta_{L C}\right)+\theta_{C A}\right)+T_{A}
\end{aligned}
$$

Inserting the values for $\theta_{\mathrm{LC}}$ and $\theta_{\text {DC }}$ shown in Figure 28 gives:

$$
\begin{aligned}
T_{J E} & =\mathrm{P}_{E} \cdot\left(256^{\circ} \mathrm{C} / \mathrm{W}+\theta_{C A}\right) \\
& +\mathrm{P}_{D} \cdot\left(57^{\circ} \mathrm{C} / \mathrm{W}+\theta_{C A}\right)+T_{A} \\
T_{J D} & =\mathrm{P}_{E} \cdot\left(57^{\circ} \mathrm{C} / \mathrm{W}+\theta_{C A}\right) \\
& +\mathrm{P}_{D} \cdot\left(111^{\circ} \mathrm{C} / \mathrm{W}+\theta_{C A}\right)+T_{A}
\end{aligned}
$$

For example, given $\mathrm{P}_{\mathrm{E}}=45 \mathrm{~mW}$, $\mathrm{P}_{\mathrm{O}}=250 \mathrm{~mW}, \mathrm{~T}_{\mathrm{A}}=70^{\circ} \mathrm{C}$ and $\theta_{\mathrm{CA}}$ $=83^{\circ} \mathrm{C} / \mathrm{W}$ :

$$
\begin{aligned}
T_{J E}= & \mathrm{P}_{E} \bullet 339^{\circ} \mathrm{C} / \mathrm{W}+\mathrm{P}_{D} \bullet 140^{\circ} \mathrm{C} / \mathrm{W}+ \\
T_{A}= & 45 \mathrm{~mW} \cdot 339^{\circ} \mathrm{C} / \mathrm{W}+250 \mathrm{~mW} \\
& \bullet 140^{\circ} \mathrm{C} / \mathrm{W}+70^{\circ} \mathrm{C}=120^{\circ} \mathrm{C} \\
& \\
T_{J D}= & \mathrm{P}_{E} \cdot 140^{\circ} \mathrm{C} / \mathrm{W}+\mathrm{P}_{D} \bullet 194^{\circ} \mathrm{C} / \mathrm{W}+ \\
T_{A}= & 45 \mathrm{~mW} \cdot 140 \mathrm{C} / \mathrm{W}+250 \mathrm{~mW} \\
& \cdot 194^{\circ} \mathrm{C} / \mathrm{W}+70^{\circ} \mathrm{C}=125^{\circ} \mathrm{C}
\end{aligned}
$$

$T_{J E}$ and $T_{J D}$ should be limited to $125^{\circ} \mathrm{C}$ based on the board layout and part placement $\left(\theta_{\mathrm{CA}}\right)$ specific to the application.

$\mathrm{T}_{\mathrm{JE}}=\mathrm{LED}$ junction temperature
$\mathrm{T}_{\mathrm{JD}}=$ detector IC junction temperature
$\mathrm{T}_{\mathrm{C}}=$ case temperature measured at the center of the package bottom $\theta_{\mathrm{LC}}=$ LED-to-case thermal resistance
$\theta_{\mathrm{LD}}=$ LED-to-detector thermal resistance
$\theta_{\mathrm{DC}}=$ detector-to-case thermal resistance
$\theta_{\mathrm{CA}}=$ case-to-ambient thermal resistance
$* \theta_{\mathrm{CA}}$ will depend on the board design and the placement of the part.

Figure 28. Thermal Model.

## LED Drive Circuit

Considerations for Ultra High CMR Performance. (Discussion applies to HCPL3120, HCPL-J312, and HCNW3120)
Without a detector shield, the dominant cause of optocoupler CMR failure is capacitive coupling from the input side of the optocoupler, through the package, to the detector IC as shown in Figure 29. The HCPL3120 improves CMR performance
by using a detector IC with an optically transparent Faraday shield, which diverts the capacitively coupled current away from the sensitive IC circuitry. However, this shield does not eliminate the capacitive coupling between the LED and optocoupler pins 5-8 as shown in Figure 30. This capacitive coupling causes perturbations in the LED current during common mode transients and becomes the major source of CMR failures for
a shielded optocoupler. The main design objective of a high CMR LED drive circuit becomes keeping the LED in the proper state (on or off) during common mode transients. For example, the recommended application circuit (Figure 25), can achieve $15 \mathrm{kV} / \mu \mathrm{s}$ CMR while minimizing component complexity.

Techniques to keep the LED in the proper state are discussed in the next two sections.

Figure 29. Optocoupler Input to Output Capacitance Model for Unshielded Optocouplers.

Figure 30. Optocoupler Input to Output Capacitance Model for Shielded Optocouplers.

## CMR with the LED On ( $\mathbf{C M R}_{\mathrm{H}}$ ).

A high CMR LED drive circuit must keep the LED on during common mode transients. This is achieved by overdriving the LED current beyond the input threshold so that it is not pulled below the threshold during a transient. A minimum LED current of 10 mA provides adequate margin over the maximum $I_{\text {FLH }}$ of 5 mA to achieve $15 \mathrm{kV} / \mu \mathrm{s}$ CMR.

## CMR with the LED Off $\left(\mathrm{CMR}_{\mathrm{L}}\right)$.

A high CMR LED drive circuit must keep the LED off ( $\mathrm{V}_{\mathrm{F}} \leq$ $\mathrm{V}_{\mathrm{F}(\mathrm{OFF})}$ ) during common mode transients. For example, during a -dV cm $/ \mathrm{dt}$ transient in Figure 31, the current flowing through $\mathrm{C}_{\text {LEDP }}$ also flows through the $\mathrm{R}_{\mathrm{SAT}}$ and $\mathrm{V}_{\mathrm{SAT}}$ of the logic gate. As long as the low state voltage developed across the logic gate is less than $\mathrm{V}_{\mathrm{F}(\mathrm{FFF})}$, the LED will remain off and no common mode failure will occur.

The open collector drive circuit, shown in Figure 32, cannot keep the LED off during a $+\mathrm{dVcm} / \mathrm{dt}$ transient, since all the current flowing through $\mathrm{C}_{\text {LEDN }}$ must be supplied by the LED, and it is not recommended for applications requiring ultra high $\mathrm{CMR}_{\mathrm{L}}$ performance. Figure 33 is an alternative drive circuit which, like the recommended application circuit (Figure 25), does achieve ultra high CMR performance by shunting the LED in the off state.

Figure 31. Equivalent Circuit for Figure 25 During Common Mode Transient.

Figure 32. Not Recommended Open Collector Drive Circuit.

Figure 33. Recommended LED Drive Circuit for Ultra-High CMR.

## Under Voltage Lockout

 Feature. (Discussion applies to HCPL-3120, HCPL-J312, and HCNW3120)The HCPL-3120 contains an under voltage lockout (UVLO) feature that is designed to protect the IGBT under fault conditions which cause the HCPL-3120 supply voltage (equivalent to the

Figure 34. Under Voltage Lock Out.
fully-charged IGBT gate voltage) to drop below a level necessary to keep the IGBT in a low resistance state. When the HCPL-3120 output is in the high state and the supply voltage drops below the HCPL-3120 V UVLO- threshold $\left(9.5<\mathrm{V}_{\text {UVLO- }}<12.0\right)$ the optocoupler output will go into the low state with a typical delay, UVLO Turn Off Delay, of $0.6 \mu \mathrm{~s}$.

When the HCPL-3120 output is in the low state and the supply voltage rises above the HCPL$3120 \mathrm{~V}_{\mathrm{UVLO}}+$ threshold $(11.0<$ $\mathrm{V}_{\text {UVLO }}<13.5$ ) the optocoupler output will go into the high state (assumes LED is "ON") with a typical delay, UVLO Turn On Delay of $0.8 \mu \mathrm{~s}$.

## IPM Dead Time and

 Propagation Delay Specifications. (Discussion applies to HCPL-3120, HCPLJ312, and HCNW3120)The HCPL-3120 includes a Propagation Delay Difference (PDD) specification intended to help designers minimize "dead time" in their power inverter
designs. Dead time is the time period during which both the high and low side power transistors (Q1 and Q2 in Figure 25) are off. Any overlap in Q1 and Q2 conduction will result in large currents flowing through the power devices between the high and low voltage motor rails.

*PDD = PROPAGATION DELAY DIFFERENCE
NOTE: FOR PDD CALCULATIONS THE PROPAGATION DELAYS ARE TAKEN AT THE SAME TEMPERATURE AND TEST CONDITIONS.

Figure 35. Minimum LED Skew for Zero Dead Time.

$=\left(\right.$ tPHL MAX $^{-t_{\text {PHL }}}$ MIN $)+\left(\right.$ tPLH MAX $^{-t_{P L H}}$ MIN $)$
 $=P^{2} D^{\star}$ MAX - PDD $^{\star}$ MIN
*PDD = PROPAGATION DELAY DIFFERENCE NOTE: FOR DEAD TIME AND PDD CALCULATIONS ALL PROPAGATION deLAys are taken at the same temperature and test conditions.

Figure 36. Waveforms for Dead Time.

Figure 37. Thermal Derating Curve, Dependence of Safety Limiting Value with Case Temperature per IEC/EN/DIN EN 60747-5-2.

To minimize dead time in a given design, the turn on of LED2 should be delayed (relative to the turn off of LED1) so that under worst-case conditions, transistor Q1 has just turned off when transistor Q2 turns on, as shown in Figure 35. The amount of delay necessary to achieve this conditions is equal to the maximum value of the propagation delay difference specification, $\mathrm{PDD}_{\mathrm{MAX}}$, which is specified to be 350 ns over the operating temperature range of $-40^{\circ} \mathrm{C}$ to $100^{\circ} \mathrm{C}$.

Delaying the LED signal by the maximum propagation delay difference ensures that the minimum dead time is zero, but it does not tell a designer what the maximum dead time will be. The maximum dead time is equivalent to the difference between the maximum and minimum propagation delay difference specifications as shown in Figure 36. The maximum dead time for the HCPL-3120 is 700 ns ( $=350 \mathrm{~ns}-$ ( -350 ns )) over an operating temperature range of $-40^{\circ} \mathrm{C}$ to $100^{\circ} \mathrm{C}$.

Note that the propagation delays used to calculate PDD and dead time are taken at equal temperatures and test conditions since the optocouplers under consideration are typically mounted in close proximity to each other and are switching identical IGBTs.
