## ***Volume 2: Mnemonic Instruction Set***

Literature Number: SPRU172C  
March 2001

Printed on Recycled Paper

## IMPORTANT NOTICE

Texas Instruments and its subsidiaries (TI) reserve the right to make changes to their products or to discontinue any product or service without notice, and advise customers to obtain the latest version of relevant information to verify, before placing orders, that information being relied on is current and complete. All products are sold subject to the terms and conditions of sale supplied at the time of order acknowledgment, including those pertaining to warranty, patent infringement, and limitation of liability.

TI warrants performance of its products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are utilized to the extent TI deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

Customers are responsible for their applications using TI components.

In order to minimize risks associated with the customer's applications, adequate design and operating safeguards must be provided by the customer to minimize inherent or procedural hazards.

TI assumes no liability for applications assistance or customer product design. TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of TI covering or relating to any combination, machine, or process in which such products or services might be or are used. TI's publication of information regarding any third party's products or services does not constitute TI's approval, license, warranty or endorsement thereof.

Reproduction of information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations and notices. Representation or reproduction of this information with alteration voids all warranties provided for an associated TI product or service, is an unfair and deceptive business practice, and TI is not responsible nor liable for any such use.

Resale of TI's products or services with *statements different from or beyond the parameters* stated by TI for that products or service voids all express and any implied warranties for the associated TI product or service, is an unfair and deceptive business practice, and TI is not responsible nor liable for any such use.

### ***About This Manual***

The TMS320C54x™ DSP is a fixed-point digital signal processor (DSP) in the TMS320™ DSP family and it can use either of two forms of the instruction set: a mnemonic form or an algebraic form. This book is a reference for the mnemonic form of the instruction set. It contains information about the instructions used for all types of operations (arithmetic, logical, load and store, conditional, and program control), the nomenclature used in describing the instruction operation, and supplemental information you may need, such as interrupt priorities and locations. For information about the algebraic form of the instruction set, see *TMS320C54x DSP Reference Set, Volume 3: Algebraic Instruction Set*, literature number SPRU179.

### ***How to Use This Manual***

The following table summarizes the C54x™ DSP information contained in this book:

<b>If you are looking for information about:</b>	<b>Turn to:</b>
Arithmetic operations	Chapter 2, <i>Instruction Set Summary</i>
Conditions for conditional instructions	Appendix A, <i>Condition Codes</i>
Control register layout	Appendix B, <i>CPU Status and Control Registers</i>
Example description of instruction	Chapter 1, <i>Symbols and Abbreviations</i>
Individual instruction descriptions	Chapter 4, <i>Assembly Language Instructions</i>
Instruction set abbreviations	Chapter 1, <i>Symbols and Abbreviations</i>
Instruction set classes	Chapter 3, <i>Instruction Classes and Cycles</i>

If you are looking for information about:	Turn to:
Instruction set symbols	Chapter 1, <i>Symbols and Abbreviations</i>
Load and store operations	Chapter 2, <i>Instruction Set Summary</i>
Logical operations	Chapter 2, <i>Instruction Set Summary</i>
Program control operations	Chapter 2, <i>Instruction Set Summary</i>
Status register layout	Appendix B, <i>CPU Status and Control Registers</i>
Summary of instructions	Chapter 2, <i>Instruction Set Summary</i>

## Notational Conventions

This book uses the following conventions.

- Program listings and program examples are shown in a special typeface.

Here is a segment of a program listing:

```
LMS *AR3+, *AR4+
```

- In syntax descriptions, the instruction is in a **bold typeface** and parameters are in an *italic typeface*. Portions of a syntax in **bold** must be entered as shown; portions of a syntax in *italics* describe the type of information that you specify. Here is an example of an instruction syntax:

**LMS** *Xmem*, *Ymem*

**LMS** is the instruction, and it has two parameters, *Xmem* and *Ymem*. When you use **LMS**, the parameters should be actual dual data-memory operand values. A comma and a space (optional) must separate the two values.

- The term OR is used in the assembly language instructions to denote a Boolean operation. The term or is used to indicate selection. Here is an example of an instruction with OR and or:

```
lk OR (src) → src or [dst]
```

This instruction ORs the value of lk with the contents of src. Then, it stores the result in src or dst, depending on the syntax of the instruction.

- Square brackets, [ and ], identify an optional parameter. If you use an optional parameter, specify the information within the brackets; do not type the brackets themselves.

## **Related Documentation From Texas Instruments**

The following books describe the TMS320C54x™ DSP and related support tools. To obtain a copy of any of these TI documents, call the Texas Instruments Literature Response Center at (800) 477-8924. When ordering, please identify the book by its title and literature number. Many of these documents are located on the internet at <http://www.ti.com>.

**TMS320C54x DSP Reference Set, Volume 1: CPU** (literature number SPRU131) describes the TMS320C54x™ 16-bit fixed-point general-purpose digital signal processors. Covered are its architecture, internal register structure, data and program addressing, and the instruction pipeline. Also includes development support information, parts lists, and design considerations for using the XDS510™ emulator.

**TMS320C54x DSP Reference Set, Volume 2: Mnemonic Instruction Set** (literature number SPRU172) describes the TMS320C54x™ digital signal processor mnemonic instructions individually. Also includes a summary of instruction set classes and cycles.

**TMS320C54x DSP Reference Set, Volume 3: Algebraic Instruction Set** (literature number SPRU179) describes the TMS320C54x™ digital signal processor algebraic instructions individually. Also includes a summary of instruction set classes and cycles.

**TMS320C54x DSP Reference Set, Volume 4: Applications Guide** (literature number SPRU173) describes software and hardware applications for the TMS320C54x™ digital signal processor. Also includes development support information, parts lists, and design considerations for using the XDS510™ emulator.

**TMS320C54x DSP Reference Set, Volume 5: Enhanced Peripherals** (literature number SPRU302) describes the enhanced peripherals available on the TMS320C54x™ digital signal processors. Includes the multi-channel buffered serial ports (McBSPs), direct memory access (DMA) controller, interprocessor communications, and the HPI-8 and HPI-16 host port interfaces.

**TMS320C54x DSP Family Functional Overview** (literature number SPRU307) provides a functional overview of the devices included in the TMS320C54x™ DSP generation of digital signal processors. Included are descriptions of the CPU architecture, bus structure, memory structure, on-chip peripherals, and instruction set.

**TMS320C54x DSKplus User's Guide** (literature number SPRU191) describes the TMS320C54x™ digital signal processor starter kit (DSK), which allows you to execute custom TMS320C54x DSP code in real time and debug it line by line. Covered are installation procedures, a description of the debugger and the assembler, customized applications, and initialization routines.

**TMS320C54x Code Composer Studio Tutorial** (literature number SPRU327) introduces the Code Composer Studio integrated development environment and software tools for the TMS320C54x.

**Code Composer User's Guide** (literature number SPRU328) explains how to use the Code Composer development environment to build and debug embedded real-time DSP applications.

**TMS320C54x Assembly Language Tools User's Guide** (literature number SPRU102) describes the assembly language tools (assembler, linker, and other tools used to develop assembly language code), assembler directives, macros, common object file format, and symbolic debugging directives for the TMS320C54x™ generation of devices.

**TMS320C54x Optimizing C Compiler User's Guide** (literature number SPRU103) describes the TMS320C54x™ C compiler. This C compiler accepts ANSI standard C source code and produces assembly language source code for the TMS320C54x generation of devices.

**TMS320C54x Simulator Getting Started** (literature number SPRU137) describes how to install the TMS320C54x™ simulator and the C source debugger for the TMS320C54x DSP. The installation for MS-DOS™, PC-DOS™, SunOS™, Solaris™, and HP-UX™ systems is covered.

**TMS320C54x Evaluation Module Technical Reference** (literature number SPRU135) describes the TMS320C54x™ evaluation module, its features, design details and external interfaces.

**TMS320C54x Code Generation Tools Getting Started Guide** (literature number SPRU147) describes how to install the TMS320C54x™ assembly language tools and the C compiler for the TMS320C54x devices. The installation for MS-DOS™, OS/2™, SunOS™, Solaris™, and HP-UX™ 9.0x systems is covered.

**TMS320C5xx C Source Debugger User's Guide** (literature number SPRU099) tells you how to invoke the TMS320C54x™ emulator, evaluation module, and simulator versions of the C source debugger interface. This book discusses various aspects of the debugger interface, including window management, command entry, code execution, data management, and breakpoints. It also includes a tutorial that introduces basic debugger functionality.

**TMS320C54x Simulator Addendum** (literature number SPRU170) tells you how to define and use a memory map to simulate ports for the TMS320C54x™ DSP. This addendum to the *TMS320C5xx C Source Debugger User's Guide* discusses standard serial ports, buffered serial ports, and time division multiplexed (TDM) serial ports.

**Setting Up TMS320 DSP Interrupts in C Application Report** (literature number SPRA036) describes methods of setting up interrupts for the TMS320™ DSP family of processors in C programming language. Sample code segments are provided, along with complete examples of how to set up interrupt vectors.

**TMS320VC5402 and TMS320UC5402 Bootloader** (literature number SPRA618) describes the features and operation of the TMS320VC5402 and TMS320UC5402 bootloader. Also discussed is the contents of the on-chip ROM.

**TMS320C548/C549 Bootloader Technical Reference** (literature number SPRU288) describes the process the bootloader uses to transfer user code from an external source to the program memory at power up. (Presently available only on the internet.)

**TMS320 Third-Party Support Reference Guide** (literature number SPRU052) alphabetically lists over 100 third parties that provide various products that serve the TMS320™ DSP family. A myriad of products and applications are offered—software and hardware development tools, speech recognition, image processing, noise cancellation, modems, etc.

## Trademarks

TMS320, TMS320C2x, TMS320C20x, TMS320C24x, TMS320C5x, TMS320C54x, C54x, 320 Hotline On-line, Micro Star, TI, XDS510, and XDS510WS are trademarks of Texas Instruments.

HP-UX is a trademark of Hewlett-Packard Company.

MS-DOS and Windows are trademarks of Microsoft Corporation.

OS/2 and PC-DOS are trademarks of International Business Machines Corporation.

PAL® is a registered trademark of Advanced Micro Devices, Inc.

Solaris and SunOS are trademarks of Sun Microsystems, Inc.

SPARC is a trademark of SPARC International, Inc., but licensed exclusively to Sun Microsystems, Inc.

# Symbols and Abbreviations

---

---

---

---

This chapter lists and defines the symbols and abbreviations used in the instruction set summary and in the individual instruction descriptions. It also provides an example description of an instruction.

<b>Topic</b>	<b>Page</b>
1.1 Instruction Set Symbols and Abbreviations .....	1-2
1.2 Example Description of Instruction .....	1-9

## 1.1 Instruction Set Symbols and Abbreviations

Table 1–1 through Table 1–4 list the symbols and abbreviations used in the instruction set summary (Chapter 2) and in the individual instruction descriptions (Chapter 4).

*Table 1–1. Instruction Set Symbols and Abbreviations*

<b>Symbol</b>	<b>Meaning</b>
A	Accumulator A
ALU	Arithmetic logic unit
AR	Auxiliary register, general usage
ARx	Designates a specific auxiliary register ( $0 \leq x \leq 7$ )
ARP	Auxiliary register pointer field in ST0; this 3-bit field points to the current auxiliary register (AR).
ASM	5-bit accumulator shift mode field in ST1 ( $-16 \leq ASM \leq 15$ )
B	Accumulator B
BRAF	Block-repeat active flag in ST1
BRC	Block-repeat counter
BITC	4-bit value that determines which bit of a designated data memory value is tested by the test bit instruction ( $0 \leq BITC \leq 15$ )
C16	Dual 16-bit/double-precision arithmetic mode bit in ST1
C	Carry bit in ST0
CC	2-bit condition code ( $0 \leq CC \leq 3$ )
CMPT	Compatibility mode bit in ST1
CPL	Compiler mode bit in ST1
cond	An operand representing a condition used by instructions that execute conditionally
[D]	Delay option
DAB	D address bus
DAR	DAB address register
dmad	16-bit immediate data-memory address ( $0 \leq dmad \leq 65\,535$ )
Dmem	Data-memory operand

Table 1–1. Instruction Set Symbols and Abbreviations (Continued)

Symbol	Meaning
DP	9-bit data-memory page pointer field in ST0 ( $0 \leq DP \leq 511$ )
dst	Destination accumulator (A or B)
dst_	Opposite destination accumulator: If dst = A, then dst_ = B If dst = B, then dst_ = A
EAB	E address bus
EAR	EAB address register
extpmad	23-bit immediate program-memory address
FRCT	Fractional mode bit in ST1
hi(A)	High part of accumulator A (bits 31–16)
HM	Hold mode bit in ST1
IFR	Interrupt flag register
INTM	Interrupt mode bit in ST1
K	Short-immediate value of less than 9 bits
k3	3-bit immediate value ( $0 \leq k3 \leq 7$ )
k5	5-bit immediate value ( $-16 \leq k5 \leq 15$ )
k9	9-bit immediate value ( $0 \leq k9 \leq 511$ )
lk	16-bit long-immediate value
Lmem	32-bit single data-memory operand using long-word addressing
mmr, MMR	Memory-mapped register
MMRx, MMRy	Memory-mapped register, AR0–AR7 or SP
n	Number of words following the XC instruction; $n = 1$ or $2$
N	Designates the status register modified in the RSBX, SSBX, and XC instructions: N = 0 Status register ST0 N = 1 Status register ST1

Table 1–1. Instruction Set Symbols and Abbreviations (Continued)

Symbol	Meaning
OVA	Overflow flag for accumulator A in ST0
OVB	Overflow flag for accumulator B in ST0
OVdst	Overflow flag for the destination accumulator (A or B)
OVdst_	Overflow flag for the opposite destination accumulator (A or B)
OVsrc	Overflow flag for the source accumulator (A or B)
OVM	Overflow mode bit in ST1
PA	16-bit port immediate address ( $0 \leq PA \leq 65\,535$ )
PAR	Program address register
PC	Program counter
pmad	16-bit immediate program-memory address ( $0 \leq pmad \leq 65\,535$ )
Pmem	Program-memory operand
PMST	Processor mode status register
prog	Program-memory operand
[R]	Rounding option
RC	Repeat counter
REA	Block-repeat end address register
rnd	Round
RSA	Block-repeat start address register
RTN	Fast-return register used in RETF[D] instruction
SBIT	4-bit value that designates the status register bit number modified in the RSBX, SSBX, and XC instructions ( $0 \leq SBIT \leq 15$ )
SHFT	4-bit shift value ( $0 \leq SHFT \leq 15$ )
SHIFT	5-bit shift value ( $-16 \leq SHIFT \leq 15$ )
Sind	Single data-memory operand using indirect addressing
Smem	16-bit single data-memory operand
SP	Stack pointer
src	Source accumulator (A or B)

Table 1–1. Instruction Set Symbols and Abbreviations (Continued)

<b>Symbol</b>	<b>Meaning</b>
ST0, ST1	Status register 0, status register 1
SXM	Sign-extension mode bit in ST1
T	Temporary register
TC	Test/control flag in ST0
TOS	Top of stack
TRN	Transition register
TS	Shift value specified by bits 5–0 of T ( $-16 \leq TS \leq 31$ )
uns	Unsigned
XF	External flag status bit in ST1
XPC	Program counter extension register
Xmem	16-bit dual data-memory operand used in dual-operand instructions and some single-operand instructions
Ymem	16-bit dual data-memory operand used in dual-operand instructions
-- SP	Stack pointer value is decremented by 1
++ SP	Stack pointer value is incremented by 1
++ PC	Program counter value is incremented by 1

Table 1–2. Opcode Symbols and Abbreviations

<b>Symbol</b>	<b>Meaning</b>
A	Data-memory address bit
ARX	3-bit value that designates the auxiliary register
BITC	4-bit bit code
CC	2-bit condition code
CCCC CCCC	8-bit condition code
COND	4-bit condition code

Table 1–2. Opcode Symbols and Abbreviations (Continued)

Symbol	Meaning
D	Destination (dst) accumulator bit D = 0 Accumulator A D = 1 Accumulator B
I	Addressing mode bit I = 0 Direct addressing mode I = 1 Indirect addressing mode
K	Short-immediate value of less than 9 bits
MMRX	4-bit value that designates one of nine memory-mapped registers ( $0 \leq \text{MMRX} \leq 8$ )
MMRY	4-bit value that designates one of nine memory-mapped registers ( $0 \leq \text{MMRY} \leq 8$ )
N	Single bit
NN	2-bit value that determines the type of interrupt
R	Rounding (rnd) option bit R = 0 Execute instruction without rounding R = 1 Round the result
S	Source (src) accumulator bit S = 0 Accumulator A S = 1 Accumulator B
SBIT	4-bit status register bit number
SHFT	4-bit shift value ( $0 \leq \text{SHFT} \leq 15$ )
SHIFT	5-bit shift value ( $-16 \leq \text{SHIFT} \leq 15$ )
X	Data-memory bit
Y	Data-memory bit
Z	Delay instruction bit Z = 0 Execute instruction without delay Z = 1 Execute instruction with delay

Table 1–3. Instruction Set Notations

Symbol	Meaning
<b>Boldface Characters</b>	Boldface characters in an instruction syntax must be typed as shown. <i>Example:</i> For the syntax <b>ADD</b> <i>Xmem</i> , <i>Ymem</i> , <i>dst</i> , you can use a variety of values for <i>Xmem</i> and <i>Ymem</i> , but the word <b>ADD</b> must be typed as shown.
<i>italic symbols</i>	Italic symbols in an instruction syntax represent variables. <i>Example:</i> For the syntax <b>ADD</b> <i>Xmem</i> , <i>Ymem</i> , <i>dst</i> , you can use a variety of values for <i>Xmem</i> and <i>Ymem</i> .
[ x ]	Operands in square brackets are optional. <i>Example:</i> For the syntax <b>ADD</b> <i>Smem</i> [ , <i>SHIFT</i> ], <i>src</i> [ , <i>dst</i> ], you must use a value for <i>Smem</i> and <i>src</i> ; however, <i>SHIFT</i> and <i>dst</i> are optional.
#	Prefix of constants used in immediate addressing. For short- or long-immediate operands, # is used in instructions where there is ambiguity with other addressing modes that use immediate operands. For example:  RPT #15 uses short immediate addressing. It causes the next instruction to be repeated 16 times. RPT 15 uses direct addressing. The number of times the next instruction repeats is determined by a value stored in memory.  For instructions using immediate operands for which there is no ambiguity, # is accepted by the assembler. For example, RPTZ A, #15 and RPTZ A, 15 are equivalent.
(abc)	The content of a register or location abc. <i>Example:</i> (src) means <i>the content of the source accumulator</i> .
x → y	Value x is assigned to register or location y. <i>Example:</i> (Smem) → dst means <i>the content of the data-memory value is loaded into the destination accumulator</i> .
r(n–m)	Bits n through m of register or location r. <i>Example:</i> src(15–0) means <i>bits 15 through 0 of the source accumulator</i> .
<< nn	Shift of nn bits left (negative or positive)
	Parallel instruction
\	Rotate left
//	Rotate right
$\bar{x}$	Logical inversion (1s complement) of x
x	Absolute value of x
AAh	Indicates that AA represents a hexadecimal number

Table 1–4. Operators Used in Instruction Set

Symbols	Operators	Evaluation
+ - ~	Unary plus, minus, 1s complement	Right to left
* / %	Multiplication, division, modulo	Left to right
+ -	Addition, subtraction	Left to right
<< >>	Left shift, right shift	Left to right
<<<	Logical left shift	Left to right
< ≤	Less than, LT or equal	Left to right
> ≥	Greater than, GT or equal	Left to right
≠ !=	Not equal to	Left to right
&	Bitwise AND	Left to right
^	Bitwise exclusive OR	Left to right
	Bitwise OR	Left to right

**Note:** Unary +, −, and \* have higher precedence than the binary forms.

## 1.2 Example Description of Instruction

This example of a typical instruction description is provided to familiarize you with the format of the instruction descriptions and to explain what is described under each heading. Each instruction description in Chapter 4 presents the following information:

- Assembler syntax
- Operands
- Opcode
- Execution
- Status Bits
- Description
- Words
- Cycles
- Classes
- Examples

Each instruction description begins with an assembly syntax expression. Labels may be placed either before the instruction on the same line or on the preceding line in the first column. An optional comment field may conclude the syntax expression. Spaces are required between the fields:

- Label
- Command and operands
- Comment

- Syntax**
- 1: **EXAMPLE** *Smem*, *src*
  - 2: **EXAMPLE** *Smem*, **TS**, *src*
  - 3: **EXAMPLE** *Smem*, **16**, *src* [, *dst* ]
  - 4: **EXAMPLE** *Smem* [, *SHIFT*], *src* [, *dst* ]

Each instruction description begins with an assembly syntax expression. See Section 1.1 on page 1-2 for definitions of symbols in the syntax.

- Operands**
- Smem*: Single data-memory operand
  - Xmem*, *Ymem*: Dual data-memory operands
  - src*, *dst*: A (accumulator A)  
B (accumulator B)
- $-16 \leq \text{SHIFT} \leq 15$

Operands may be constants or assembly-time expressions that refer to memory, I/O ports, register addresses, pointers, and a variety of other constants. This section also gives the range of acceptable values for the operand types.

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

The opcode breaks down the various bit fields that make up each instruction. See Section 1.1 on page 1-2 for definitions of symbols in the instruction opcode.

- Execution**
- 1: (*Smem*) + (*src*) → *src*
  - 2: (*Smem*) << (**TS**) + (*src*) → *src*
  - 3: (*Smem*) << **16** + (*src*) → *dst*
  - 4: (*Smem*) [ << *SHIFT* ] + (*src*) → *dst*

The execution section describes the processing that takes place when the instruction is executed. The example executions are numbered to correspond to the numbered syntaxes. See Section 1.1 on page 1-2 for definitions of symbols in the execution.

**Status Bits** An instruction’s execution may be affected by the state of the fields in the status registers; also it may affect the state of the status register fields. Both the effects *on* and the effects *of* the status register fields are listed in this section.

**Description** This section describes the instruction execution and its effect on the rest of the processor or on memory contents. Any constraints on the operands imposed by the processor or the assembler are discussed. The description parallels and supplements the information given symbolically in the execution section.

<b>Words</b>	This field specifies the number of memory words required to store the instruction and its extension words. For instructions operating in single-addressing mode, the number of words given is for all modifiers except for long-offset modifiers, which require one additional word.
<b>Cycles</b>	This field specifies the number of cycles required for a given C54x DSP instruction to execute as a single instruction with data accesses in DARAM and program accesses from ROM. Additional details on the number of cycles required for other memory configurations and repeat modes are given in Chapter 3, <i>Instruction Classes and Cycles</i> .
<b>Classes</b>	This field specifies the instruction class for each syntax of the instruction. See Chapter 3, <i>Instruction Classes and Cycles</i> , for a description of each class.
<b>Example</b>	Example code is included for each instruction. The effect of the code on memory and/or registers is summarized when appropriate.

# Instruction Set Summary

---

---

---

The TMS320C54x™ DSP instruction set can be divided into four basic types of operations:

- Arithmetic operations
- Logical operations
- Program-control operations
- Load and store operations

In this chapter, each of the types of operations is divided into smaller groups of instructions with similar functions. With each instruction listing, you will find the best possible numbers for word count and cycle time, and the instruction class. You will also find a page number that directs you to the appropriate place in the instruction set of Chapter 4. Also included is information on repeating a single instruction and a list of nonrepeatable instructions.

## 2.1 Arithmetic Operations

This section summarizes the arithmetic operation instructions. Table 2–1 through Table 2–6 list the instructions within the following functional groups:

- Add instructions (Table 2–1)
- Subtract instructions (Table 2–2 on page 2-3)
- Multiply instructions (Table 2–3 on page 2-4)
- Multiply-accumulate instructions (Table 2–4 on page 2-4)
- Multiply-subtract instructions (Table 2–4 on page 2-4)
- Double (32-bit operand) instructions (Table 2–5 on page 2-6)
- Application-specific instructions (Table 2–6 on page 2-7)

Table 2–1. Add Instructions

Syntax	Expression	W <sup>†</sup>	Cycles <sup>†</sup>	Class	Page
ADD <i>Smem</i> , <i>src</i>	$src = src + Smem$	1	1	3A, 3B	4-4
ADD <i>Smem</i> , TS, <i>src</i>	$src = src + Smem \ll TS$	1	1	3A, 3B	4-4
ADD <i>Smem</i> , 16, <i>src</i> [, <i>dst</i> ]	$dst = src + Smem \ll 16$	1	1	3A, 3B	4-4
ADD <i>Smem</i> [, SHIFT], <i>src</i> [, <i>dst</i> ]	$dst = src + Smem \ll SHIFT$	2	2	4A, 4B	4-4
ADD <i>Xmem</i> , SHFT, <i>src</i>	$src = src + Xmem \ll SHFT$	1	1	3A	4-4
ADD <i>Xmem</i> , <i>Ymem</i> , <i>dst</i>	$dst = Xmem \ll 16 + Ymem \ll 16$	1	1	7	4-4
ADD # <i>lk</i> [, SHFT], <i>src</i> [, <i>dst</i> ]	$dst = src + \#lk \ll SHFT$	2	2	2	4-4
ADD # <i>lk</i> , 16, <i>src</i> [, <i>dst</i> ]	$dst = src + \#lk \ll 16$	2	2	2	4-4
ADD <i>src</i> [, SHIFT] [, <i>dst</i> ]	$dst = dst + src \ll SHIFT$	1	1	1	4-4
ADD <i>src</i> , ASM [, <i>dst</i> ]	$dst = dst + src \ll ASM$	1	1	1	4-4
ADDC <i>Smem</i> , <i>src</i>	$src = src + Smem + C$	1	1	3A, 3B	4-8
ADDM # <i>lk</i> , <i>Smem</i>	$Smem = Smem + \#lk$	2	2	18A, 18B	4-9
ADDS <i>Smem</i> , <i>src</i>	$src = src + uns(Smem)$	1	1	3A, 3B	4-10

<sup>†</sup> Values for words (W) and cycles assume the use of DARAM for data. Add 1 word and 1 cycle when using long-offset indirect addressing or absolute addressing with an *Smem*.

Table 2–2. Subtract Instructions

Syntax	Expression	W†	Cycles†	Class	Page
SUB <i>Smem</i> , <i>src</i>	$src = src - Smem$	1	1	3A, 3B	4-187
SUB <i>Smem</i> , TS, <i>src</i>	$src = src - Smem \ll TS$	1	1	3A, 3B	4-187
SUB <i>Smem</i> , 16, <i>src</i> [, <i>dst</i> ]	$dst = src - Smem \ll 16$	1	1	3A, 3B	4-187
SUB <i>Smem</i> [, SHIFT], <i>src</i> [, <i>dst</i> ]	$dst = src - Smem \ll SHIFT$	2	2	4A, 4B	4-187
SUB <i>Xmem</i> , SHFT, <i>src</i>	$src = src - Xmem \ll SHFT$	1	1	3A	4-187
SUB <i>Xmem</i> , <i>Ymem</i> , <i>dst</i>	$dst = Xmem \ll 16 - Ymem \ll 16$	1	1	7	4-187
SUB #lk [, SHFT], <i>src</i> [, <i>dst</i> ]	$dst = src - \#lk \ll SHFT$	2	2	2	4-187
SUB #lk, 16, <i>src</i> [, <i>dst</i> ]	$dst = src - \#lk \ll 16$	2	2	2	4-187
SUB <i>src</i> [, SHIFT] [, <i>dst</i> ]	$dst = dst - src \ll SHIFT$	1	1	1	4-187
SUB <i>src</i> , ASM [, <i>dst</i> ]	$dst = dst - src \ll ASM$	1	1	1	4-187
SUBB <i>Smem</i> , <i>src</i>	$src = src - Smem - \bar{C}$	1	1	3A, 3B	4-191
SUBC <i>Smem</i> , <i>src</i>	If $(src - Smem \ll 15) \geq 0$ $src = (src - Smem \ll 15) \ll 1 + 1$ Else $src = src \ll 1$	1	1	3A, 3B	4-192
SUBS <i>Smem</i> , <i>src</i>	$src = src - uns(Smem)$	1	1	3A, 3B	4-194

† Values for words (W) and cycles assume the use of DARAM for data. Add 1 word and 1 cycle when using long-offset indirect addressing or absolute addressing with an *Smem*.

Table 2–3. Multiply Instructions

Syntax	Expression	W <sup>†</sup>	Cycles <sup>†</sup>	Class	Page
MPY <i>Smem, dst</i>	$dst = T * Smem$	1	1	3A, 3B	4-101
MPYR <i>Smem, dst</i>	$dst = rnd(T * Smem)$	1	1	3A, 3B	4-101
MPY <i>Xmem, Ymem, dst</i>	$dst = Xmem * Ymem, T = Xmem$	1	1	7	4-101
MPY <i>Smem, #lk, dst</i>	$dst = Smem * \#lk, T = Smem$	2	2	6A, 6B	4-101
MPY <i>#lk, dst</i>	$dst = T * \#lk$	2	2	2	4-101
MPYA <i>dst</i>	$dst = T * A(32-16)$	1	1	1	4-104
MPYA <i>Smem</i>	$B = Smem * A(32-16), T = Smem$	1	1	3A, 3B	4-104
MPYU <i>Smem, dst</i>	$dst = uns(T) * uns(Smem)$	1	1	3A, 3B	4-106
SQUR <i>Smem, dst</i>	$dst = Smem * Smem, T = Smem$	1	1	3A, 3B	4-161
SQUR <i>A, dst</i>	$dst = A(32-16) * A(32-16)$	1	1	1	4-161

<sup>†</sup> Values for words (W) and cycles assume the use of DARAM for data. Add 1 word and 1 cycle when using long-offset indirect addressing or absolute addressing with an *Smem*.

Table 2–4. Multiply-Accumulate and Multiply-Subtract Instructions

Syntax	Expression	W <sup>†</sup>	Cycles <sup>†</sup>	Class	Page
MAC <i>Smem, src</i>	$src = src + T * Smem$	1	1	3A, 3B	4-82
MAC <i>Xmem, Ymem, src [ , dst ]</i>	$dst = src + Xmem * Ymem,$ $T = Xmem$	1	1	7	4-82
MAC <i>#lk, src [ , dst ]</i>	$dst = src + T * \#lk$	2	2	2	4-82
MAC <i>Smem, #lk, src [ , dst ]</i>	$dst = src + Smem * \#lk,$ $T = Smem$	2	2	6A, 6B	4-82
MACR <i>Smem, src</i>	$src = rnd(src + T * Smem)$	1	1	3A, 3B	4-82

† Values for words (W) and cycles assume the use of DARAM for data. Add 1 word and 1 cycle when using long-offset indirect addressing or absolute addressing with an *Smem*.

## 2.2 Logical Operations

This section summarizes the logical operation instructions. Table 2–7 through Table 2–11 list the instructions within the following functional groups:

- ❑ AND instructions (Table 2–7)
- ❑ OR instructions (Table 2–8 on page 2-8)
- ❑ XOR instructions (Table 2–9 on page 2-9)
- ❑ Shift instructions (Table 2–10 on page 2-9)
- ❑ Test instructions (Table 2–11 on page 2-9)

Table 2–7. AND Instructions

Syntax	Expression	W <sup>†</sup>	Cycles <sup>†</sup>	Class	Page
AND <i>Smem</i> , <i>src</i>	$src = src \& Smem$	1	1	3A, 3B	4-11
AND <i>#lk</i> [ , <i>SHFT</i> ], <i>src</i> [ , <i>dst</i> ]	$dst = src \& \#lk \ll SHFT$	2	2	2	4-11
AND <i>#lk</i> , 16, <i>src</i> [ , <i>dst</i> ]	$dst = src \& \#lk \ll 16$	2	2	2	4-11
AND <i>src</i> [ , <i>SHIFT</i> ] [ , <i>dst</i> ]	$dst = dst \& src \ll SHIFT$	1	1	1	4-11
ANDM <i>#lk</i> , <i>Smem</i>	$Smem = Smem \& \#lk$	2	2	18A, 18B	4-13

<sup>†</sup> Values for words (W) and cycles assume the use of DARAM for data. Add 1 word and 1 cycle when using long-offset indirect addressing or absolute addressing with an *Smem*.

Table 2–8. OR Instructions

Syntax	Expression	W <sup>†</sup>	Cycles <sup>†</sup>	Class	Page
OR <i>Smem</i> , <i>src</i>	$src = src   Smem$	1	1	3A, 3B	4-123
OR <i>#lk</i> [ , <i>SHFT</i> ], <i>src</i> [ , <i>dst</i> ]	$dst = src   \#lk \ll SHFT$	2	2	2	4-123
OR <i>#lk</i> , 16, <i>src</i> [ , <i>dst</i> ]	$dst = src   \#lk \ll 16$	2	2	2	4-123
OR <i>src</i> [ , <i>SHIFT</i> ] [ , <i>dst</i> ]	$dst = dst   src \ll SHIFT$	1	1	1	4-123
ORM <i>#lk</i> , <i>Smem</i>	$Smem = Smem   \#lk$	2	2	18A, 18B	4-125

<sup>†</sup> Values for words (W) and cycles assume the use of DARAM for data. Add 1 word and 1 cycle when using long-offset indirect addressing or absolute addressing with an *Smem*.

Table 2–9. XOR Instructions

Syntax	Expression	W <sup>†</sup>	Cycles <sup>†</sup>	Class	Page
XOR <i>Smem</i> , <i>src</i>	$src = src \wedge Smem$	1	1	3A, 3B	4-201
XOR <i>#lk</i> [, <i>SHFT</i> , ], <i>src</i> [, <i>dst</i> ]	$dst = src \wedge \#lk \ll SHFT$	2	2	2	4-201
XOR <i>#lk</i> , 16, <i>src</i> [, <i>dst</i> ]	$dst = src \wedge \#lk \ll 16$	2	2	2	4-201
XOR <i>src</i> [, <i>SHIFT</i> ] [, <i>dst</i> ]	$dst = dst \wedge src \ll SHIFT$	1	1	1	4-201
XORM <i>#lk</i> , <i>Smem</i>	$Smem = Smem \wedge \#lk$	2	2	18A, 18B	4-203

<sup>†</sup> Values for words (W) and cycles assume the use of DARAM for data. Add 1 word and 1 cycle when using long-offset indirect addressing or absolute addressing with an *Smem*.

Table 2–10. Shift Instructions

Syntax	Expression	W <sup>†</sup>	Cycles <sup>†</sup>	Class	Page
ROL <i>src</i>	Rotate left with carry in	1	1	1	4-143
ROLTC <i>src</i>	Rotate left with TC in	1	1	1	4-144
ROR <i>src</i>	Rotate right with carry in	1	1	1	4-145
SFTA <i>src</i> , <i>SHIFT</i> [, <i>dst</i> ]	$dst = src \ll SHIFT$ {arithmetic shift}	1	1	1	4-155
SFTC <i>src</i>	if $src(31) = src(30)$ then $src = src \ll 1$	1	1	1	4-157
SFTL <i>src</i> , <i>SHIFT</i> [, <i>dst</i> ]	$dst = src \ll SHIFT$ {logical shift}	1	1	1	4-158

<sup>†</sup> Values for words (W) and cycles assume the use of DARAM for data.

Table 2–11. Test Instructions

Syntax	Expression	W <sup>†</sup>	Cycles <sup>†</sup>	Class	Page
BIT <i>Xmem</i> , <i>BITC</i>	$TC = Xmem(15 - BITC)$	1	1	3A	4-21
BITF <i>Smem</i> , <i>#lk</i>	$TC = (Smem \&\& \#lk)$	2	2	6A, 6B	4-22
BITT <i>Smem</i>	$TC = Smem(15 - T(3-0))$	1	1	3A, 3B	4-23
CMPM <i>Smem</i> , <i>#lk</i>	$TC = (Smem == \#lk)$	2	2	6A, 6B	4-33
CMPR <i>CC</i> , <i>ARx</i>	Compare <i>ARx</i> with <i>AR0</i>	1	1	1	4-34

<sup>†</sup> Values for words (W) and cycles assume the use of DARAM for data. Add 1 word and 1 cycle when using long-offset indirect addressing or absolute addressing with an *Smem*.

## 2.3 Program-Control Operations

This section summarizes the program-control instructions. Table 2–12 through Table 2–18 list the instructions within the following functional groups:

- Branch instructions (Table 2–12)
- Call instructions (Table 2–13 on page 2-11)
- Interrupt instructions (Table 2–14 on page 2-11)
- Return instructions (Table 2–15 on page 2-12)
- Repeat instructions (Table 2–16 on page 2-12)
- Stack-manipulating instructions (Table 2–17 on page 2-13)
- Miscellaneous program-control instructions (Table 2–18 on page 2-13)

Table 2–12. Branch Instructions

Syntax	Expression	W <sup>†</sup>	Cycles <sup>†</sup>	Class	Page
B[D] <i>pmad</i>	PC = pmad(15–0)	2	4/[2 <sup>¶</sup> ]	29A	4-14
BACC[D] <i>src</i>	PC = src(15–0)	1	6/[4 <sup>¶</sup> ]	30A	4-15
BANZ[D] <i>pmad, Sind</i>	if (Sind ≠ 0) then PC = pmad(15–0)	2	4‡/2§/ [2 <sup>¶</sup> ]	29A	4-16
BC[D] <i>pmad, cond [ , cond [ , cond ]]</i>	if (cond(s)) then PC = pmad(15–0)	2	5‡/3§/ [3 <sup>¶</sup> ]	31A	4-18
FB[D] <i>extpmad</i>	PC = pmad(15–0), XPC = pmad(22–16)	2	4/[2 <sup>¶</sup> ]	29A	4-53
FBACC[D] <i>src</i>	PC = src(15–0), XPC = src(22–16)	1	6/[4 <sup>¶</sup> ]	30A	4-54

<sup>†</sup> Values for words (W) and cycles assume the use of DARAM for data.

<sup>‡</sup> Conditions true

<sup>§</sup> Condition false

<sup>¶</sup> Delayed instruction

Table 2–13. Call Instructions

Syntax	Expression	W <sup>†</sup>	Cycles <sup>†</sup>	Class	Page
CALA[D] <i>src</i>	--SP, PC + 1[3 <sup>¶</sup> ] = TOS, PC = src(15–0)	1	6/[4 <sup>¶</sup> ]	30B	4-25

POPM <i>MMR</i>	MMR = TOS, ++SP	1	1	17A	4-128
PSHD <i>Smem</i>	--SP, Smem = TOS	1	1	16A, 16B	4-131
PSHM <i>MMR</i>	--SP, MMR = TOS	1	1	16A	4-132

<sup>†</sup> Values for words (W) and cycles assume the use of DARAM for data. Add 1 word and 1 cycle when using long-offset indirect addressing or absolute addressing with an *Smem*.

Table 2–18. Miscellaneous Program-Control Instructions

Syntax	Expression	W <sup>†</sup>	Cycles <sup>†</sup>	Class	Page
IDLE <i>K</i>	idle(K)	1	4	36	4-63
MAR <i>Smem</i>	If CMPT = 0, then modify ARx If CMPT = 1 and ARx ≠ AR0, then modify ARx, ARP = x If CMPT = 1 and ARx = AR0, then modify AR(ARP)	1	1	1, 2	4-92
NOP	no operation	1	1	1	4-121
RESET	software reset	1	3	35	4-138
RSBX <i>N, SBIT</i>	STN (SBIT) = 0	1	1	1	4-151
SSBX <i>N, SBIT</i>	STN (SBIT) = 1	1	1	1	4-166
XC <i>n, cond [ , cond [ , cond ]]</i>	If (cond(s)) then execute the next n instructions; n = 1 or 2	1	1	1	4-198

<sup>†</sup> Values for words (W) and cycles assume the use of DARAM for data. Add 1 word and 1 cycle when using long-offset indirect addressing or absolute addressing with an *Smem*.

## 2.4 Load and Store Operations

This section summarizes the load and store instructions. Table 2–19 through Table 2–26 list the instructions within the following functional groups:

- Load instructions (Table 2–19)
- Store instructions (Table 2–20 on page 2-15)
- Conditional store instructions (Table 2–21 on page 2-16)
- Parallel load and store instructions (Table 2–22 on page 2-16)
- Parallel load and multiply instructions (Table 2–23 on page 2-16)
- Parallel store and add/subtract instructions (Table 2–24 on page 2-17)
- Parallel store and multiply instructions (Table 2–25 on page 2-17)
- Miscellaneous load-type and store-type instructions (Table 2–26 on page 2-18)

Table 2–19. Load Instructions

Syntax	Expression	W <sup>†</sup>	Cycles <sup>†</sup>	Class	Page
DLD <i>Lmem, dst</i>	<i>dst</i> = <i>Lmem</i>	1	1	9A, 9B	4-42
LD <i>Smem, dst</i>	<i>dst</i> = <i>Smem</i>	1	1	3A, 3B	4-66
LD <i>Smem, TS, dst</i>	<i>dst</i> = <i>Smem</i> << TS	1	1	3A, 3B	4-66
LD <i>Smem, 16, dst</i>	<i>dst</i> = <i>Smem</i> << 16	1	1	3A, 3B	4-66

PORTW <i>Smem, PA</i>	$PA = Smem$	2	2	28A, 28B	4-130
READA <i>Smem</i>	$Smem = A$	1	5	25A, 25B	4-136
WRITA <i>Smem</i>	$A = Smem$	1	5	26A, 26B	4-196

<sup>†</sup> Values for words (W) and cycles assume the use of DARAM for data. Add 1 word and 1 cycle when using long-offset indirect addressing or absolute addressing with an *Smem*.

## 2.5 Repeating a Single Instruction

The TMS320C54x™ DSP includes repeat instructions that cause the next instruction to be repeated. The number of times for the instruction to be repeated is obtained from an operand of the instruction and is equal to this operand + 1. This value is stored in the 16-bit repeat counter (RC) register. You cannot program the value in the RC register; it is loaded by the repeat instructions only. The maximum number of executions of a given instruction is 65 536. An absolute program or data address is automatically incremented when the single-repeat feature is used.

Once a repeat instruction is decoded, all interrupts, including  $\overline{\text{NMI}}$  but not  $\overline{\text{RS}}$ , are disabled until the completion of the repeat loop. However, the C54x™ DSP does respond to the  $\overline{\text{HOLD}}$  signal while executing a repeat loop—the response depends on the value of the HM bit of status register 1 (ST1).

The repeat function can be used with some instructions, such as multiply/accumulate and block moves, to increase the execution speed of these instructions. These multicycle instructions (Table 2–27) effectively become single-cycle instructions after the first iteration of a repeat instruction.

Table 2–27. *Multicycle Instructions That Become Single-Cycle Instructions When Repeated*

Instruction	Description	# Cycles†
FIRS	Symmetrical FIR filter	3
MACD	Multiply and move result in accumulator with delay	3
MACP	Multiply and move result in accumulator	3
MVDK	Data-to-data move	2
MVDM	Data-to-MMR move	2
MVDP	Data-to-program move	4
MVKD	Data-to-data move	2
MVMD	MMR-to-data move	2
MVPD	Program-to-data move	3
READA	Read from program-memory to data memory	5
WRITA	Write data memory to program memory	5

† Number of cycles when instruction is not repeated

Single data-memory operand instructions cannot be repeated if a long offset modifier or an absolute address is used (for example, \*ARn(lk), \*+ARn(lk), \*+ARn(lk)% and \*(lk)). Instructions listed in Table 2–28 cannot be repeated using RPT or RPTZ instructions.

*Table 2–28. Nonrepeatable Instructions*

<b>Instruction</b>	<b>Description</b>
ADDM	Add long constant to data memory
ANDM	AND data memory with long constant
B[D]	Unconditional branch
BACC[D]	Branch to accumulator address
BANZ[D]	Branch on auxiliary register not 0
BC[D]	Conditional branch
CALA[D]	Call to accumulator address
CALL[D]	Unconditional call
CC[D]	Conditional call
CMPR	Compare with auxiliary register
DST	Long word (32-bit) store
FB[D]	Far branch unconditionally
FBACC[D]	Far branch to location specified by accumulator
FCALA[D]	Far call subroutine at location specified by accumulator
FCALL[D]	Far call unconditionally
FRET[D]	Far return
FRETE[D]	Enable interrupts and far return from interrupt
IDLE	Idle instructions
INTR	Interrupt trap
LD ARP	Load auxiliary register pointer (ARP)
LD DP	Load data page pointer (DP)
MVMM	Move memory-mapped register (MMR) to another MMR
ORM	OR data memory with long constant

Table 2–28. Nonrepeatable Instructions (Continued)

<b>Instruction</b>	<b>Description</b>
RC[D]	Conditional return
RESET	Software reset
RET[D]	Unconditional return
RETE[D]	Return from interrupt
RETF[D]	Fast return from interrupt
RND	Round accumulator
RPT	Repeat next instruction
RPTB[D]	Block repeat
RPTZ	Repeat next instruction and clear accumulator
RSBX	Reset status register bit
SSBX	Set status register bit
TRAP	Software trap
XC	Conditional execute
XORM	XOR data memory with long constant

# Instruction Classes and Cycles

---

---

---

Instructions are classified into several categories, or classes, according to cycles required. This chapter describes the instruction classes. Because a single instruction can have multiple syntaxes and types of execution, it can appear in multiple classes.

The tables in this chapter show the number of cycles required for a given TMS320C54x™ DSP instruction to execute in a given memory configuration when executed as a single instruction and when executed in the repeat mode. Tables are also provided for a single data-memory operand access used with a long constant. The column headings in the tables indicate the program source location. These headings are defined as follows:

- ROM** The instruction executes from internal program ROM.
- SARAM** The instruction executes from internal single-access RAM.
- DARAM** The instruction executes from internal dual-access RAM.
- External** The instruction executes from external program memory.

If a class of instructions requires memory operand(s), the row divisions in the tables indicate the location(s) of the operand(s). These locations are defined as follows:

- DARAM** The operand is in internal dual-access RAM.
- SARAM** The operand is in internal single-access RAM.
- DROM** The operand is in internal data ROM.
- PROM** The operand is in internal program ROM.
- External** The operand is in external memory.
- MMR** The operand is a memory-mapped register.

The number of cycles required for each instruction is given in terms of the processor machine cycles (the CLKOUT period). The additional wait states for program/data memory accesses and I/O accesses are defined as follows:

- d** Data-memory wait states—the number of additional clock cycles the device waits for external data-memory to respond to an access.

- io** I/O wait states—the number of additional clock cycles the device waits for an external I/O to respond to an access.
- n** Repetitions—the number of times a repeated instruction is executed.
- nd** Data-memory wait states repeated n times.
- np** Program-memory wait states repeated n times.
- npd** Program-memory wait states repeated n times.
- p** Program-memory wait states—the number of additional clock cycles the device waits for external program memory to respond to an access.
- pd** Program-memory wait states—the number of additional clock cycles the device waits for external program memory to respond to an access as a program data operand.

These variables can also use the subscripts *src*, *dst*, and *code* to indicate source, destination, and code, respectively.

All reads from external memory take at least one instruction cycle to complete, and all writes to external memory take at least two instruction cycles to complete. These external accesses take longer if additional wait-state cycles are added using the software wait-state generator or the external READY input. However, internal to the CPU all writes to external memory take only one cycle as long as no other access to the external memory is in process at the same time. This is possible because the instruction pipeline takes only one cycle to request an external write access, and the external bus interface unit completes the write access independently.

The instruction cycles are based on the following assumptions:

- At least five instructions following the current instruction are fetched from the same memory section (internal or external) as the current instruction, except in instructions that cause a program counter (PC) discontinuity, such as a branch or call.
- When executing a single instruction, there is no pipeline or bus conflict between the current instruction and any other instruction in the pipeline. The only exception is the conflict between the instruction fetch and the memory read/write access (if any) of the instruction under consideration.
- In single-instruction repeat mode, all conflicts caused by the pipelined execution of that instruction are considered.

**Class 1** 1 word, 1 cycle. No operand, or short-immediate or register operands and no memory operands.

<b>Mnemonics</b>				
ABS	MACA[R]	NORM	SFTA	
ADD	MAR	OR	SFTC	
AND	MASA[R]	RND	SFTL	
CMPL	MAX	ROL	SQUR	
CMPR	MIN	ROLTC	SSBX	
EXP	MPYA	ROR	SUB	
FRAME	MVMM	RPT	XC	
LD	NEG	RSBX	XOR	
LD T/DP/ASM/ARP	NOP	SAT		

### Cycles

#### Cycles for a Single Execution

Program		
ROM/SARAM	DARAM	External
1	1	1+p

#### Cycles for a Repeat Execution

Program		
ROM/SARAM	DARAM	External
n	n	n+p

**Class 2** 2 words, 2 cycles. Long-immediate operand and no memory operands.

**Mnemonics**

ADD	MAC	OR	SUB
AND	MAR	RPT	XOR
LD	MPY	RPTZ	

**Cycles**

**Cycles for a Single Execution**

Program		
ROM/SARAM	DARAM	External
2	2	2+2p

**Cycles for a Repeat Execution**

Program		
ROM/SARAM	DARAM	External
n+1	n+1	n+1+2p

**Class 3A** 1 word, 1 cycle. Single data-memory (Smem or Xmem) read operand or MMR read operand.

<b>Mnemonics</b>	ADD	LDM	MPYA	SUBB
	ADDC	LDR	MPYU	SUBC
	ADDS	LDU	OR	SUBS
	AND	MAC[R]	POLY	XOR
	BIT	MACA[R]	SQUR	
	BITT	MAS[R]	SQURA	
	LD	MASA	SQURS	
	LD T/DP/ASM/ARP	MPY[R]	SUB	

### Cycles

Cycles for a Single Execution

Operand	Program		
	ROM/SARAM	DARAM	External
DARAM	1	1, 2 <sup>†</sup>	1+p
SARAM	1, 2 <sup>†</sup>	1	1+p
DROM	1, 2 <sup>†</sup>	1	1+p
External	1+d	1+d	2+d+p
MMR <sup>◇</sup>	1	1	1+p

<sup>†</sup> Operand and code in same memory block

<sup>◇</sup> Add one cycle for peripheral memory-mapped access.

Cycles for a Repeat Execution

Operand	Program		
	ROM/SARAM	DARAM	External
DARAM	n	n, n+1 <sup>†</sup>	n+p
SARAM	n, n+1 <sup>†</sup>	n	n+p
DROM	n, n+1 <sup>†</sup>	n	n+p
External	n+nd	n+nd	n+1+nd+p
MMR <sup>◇</sup>	n	n	n+p

<sup>†</sup> Operand and code in same memory block

<sup>◇</sup> Add n cycles for peripheral memory-mapped access.

**Class 3B** 2 words, 2 cycles. Single data-memory (Smem) read operand using long-offset indirect addressing.

<b>Mnemonics</b>	ADD	LDU	OR	SUBS
	ADDC	MAC[R]	POLY	XOR
	ADDS	MACA[R]	SQUR	
	AND	MAS[R]	SQURA	
	BITT	MASA	SQURS	
	LD	MPY[R]	SUB	
	LD T/DP/ASM/ARP	MPYA	SUBB	
	LDR	MPYU	SUBC	

### Cycles

Cycles for a Single Execution With Long-Offset Modifier

Operand	Program		
	ROM/SARAM	DARAM	External
DARAM	2	2, 3 <sup>†</sup>	2+2p
SARAM	2, 3 <sup>†</sup>	2	2+2p
DROM	2, 3 <sup>†</sup>	2	2+2p
External	2+d	2+d	3+d+2p
MMR <sup>◇</sup>	2	2	2+2p

<sup>†</sup> Operand and code in same memory block

<sup>◇</sup> Add one cycle for peripheral memory-mapped access.

**Class 4A** 2 words, 2 cycles. Single data-memory (Smem) read operand.

**Mnemonics**            ADD                    LD                    SUB

**Cycles**

**Cycles for a Single Execution**

Operand	Program		
	ROM/SARAM	DARAM	External
DARAM	2	2, 3 <sup>†</sup>	2+2p
SARAM	2, 3 <sup>†</sup>	2	2+2p
DROM	2, 3 <sup>†</sup>	2	2+2p
External	2+d	2+d	3+d+2p
MMR <sup>◇</sup>	2	2	2+2p

<sup>†</sup> Operand and code in same memory block

<sup>◇</sup> Add one cycle for peripheral memory-mapped access.

**Cycles for a Repeat Execution**

Operand	Program		
	ROM/SARAM	DARAM	External
DARAM	n+1	n+1, n+2 <sup>†</sup>	n+1+2p
SARAM	n+1, n+2 <sup>†</sup>	n+1	n+1+2p
DROM	n+1, n+2 <sup>†</sup>	n+1	n+1+2p
External	n+1+nd	n+1+nd	n+2+nd+2p
MMR <sup>◇</sup>	n+1	n+1	n+1+2p

<sup>†</sup> Operand and code in same memory block

<sup>◇</sup> Add n cycles for peripheral memory-mapped access.

**Class 4B** 3 words, 3 cycles. Single data-memory (Smem) read operand using long-offset indirect addressing.

**Mnemonics**            ADD                            LD                            SUB

**Cycles**

Cycles for a Single Execution With Long-Offset Modifier			
Operand	Program		
Smem	ROM/SARAM	DARAM	External
DARAM	3	3, 4 <sup>†</sup>	3+3p
SARAM	3, 4 <sup>†</sup>	3	3+3p
DROM	3, 4 <sup>†</sup>	3	3+3p
External	3+d	3+d	4+d+3p
MMR <sup>◇</sup>	3	3	3+3p

<sup>†</sup> Operand and code in same memory block

<sup>◇</sup> Add one cycle for peripheral memory-mapped access.

**Class 5A** 1 word, 3 cycles. Single data-memory (Smem) read operand (with DP destination for load instruction).

**Mnemonics** LD RPT

**Cycles**

Operand	Cycles for a Single Execution		
	Program		
	ROM/SARAM	DARAM	External
DARAM	3	3	3+p
SARAM	3	3	3+p
DROM	3	3	3+p
External	3+d	3+d	3+d+p
MMR <sup>◇</sup>	3	3	3+p

<sup>◇</sup> Add one cycle for peripheral memory-mapped access.

**Class 36** 1 word, 4 cycles (minimum). Single short-immediate operand.

**Mnemonics** IDLE

**Cycles** The number of cycles needed to execute this instruction depends on the idle period.

# Assembly Language Instructions

---

---

---

---

This section provides detailed information on the instruction set for the TMS320C54x™ DSP family. The C54x™ DSP instruction set supports numerically intensive signal-processing operations as well as general-purpose applications, such as multiprocessing and high-speed control.

See Section 1.1, *Instruction Set Symbols and Abbreviations*, for definitions of symbols and abbreviations used in the description of assembly language instructions. See Section 1.2, *Example Description of Instruction*, for a description of the elements in an instruction. See Chapter 2 for a summary of the instruction set.

**Syntax**                    **ABDST** *Xmem*, *Ymem*

**Operands**                *Xmem*, *Ymem*:    Dual data-memory operands

**Opcode**

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	1	1	1	0	0	0	1	1	X	X	X	X	Y	Y	Y	Y

**Execution**                 $(B) + |(A(32-16))| \rightarrow B$   
 $((Xmem) - (Ymem)) \ll 16 \rightarrow A$

**Status Bits**              Affected by OVM, FRCT, and SXM  
 Affects C, OVA, and OVB

**Description**              This instruction calculates the absolute value of the distance between two vectors, *Xmem* and *Ymem*. The absolute value of accumulator A(32-16) is added to accumulator B. The content of *Ymem* is subtracted from *Xmem*, and the result is left-shifted 16 bits and stored in accumulator A. If the fractional mode bit is logical 1 (FRCT = 1), the absolute value is multiplied by 2.

**Words**                     1 word

**Cycles**                    1 cycle

**Classes**                  Class 7 (see page 3-12)

**Example**                  ABDST \*AR3+, \*AR4+

	Before Instruction	After Instruction
A	FF ABCD 0000	FF FFAB 0000
B	00 0000 0000	00 0000 5433
AR3	0100	0101
AR4	0200	0201
FRCT	0	0
Data Memory		
0100h	0055	0055
0200h	00AA	00AA

<b>Syntax</b>	<b>ABS</b> <i>src</i> [, <i>dst</i> ]																																	
<b>Operands</b>	src, dst: A (accumulator A) B (accumulator B)																																	
<b>Opcode</b>	<table border="1" style="border-collapse: collapse; text-align: center;"> <tr> <td style="padding: 2px 5px;">15</td><td style="padding: 2px 5px;">14</td><td style="padding: 2px 5px;">13</td><td style="padding: 2px 5px;">12</td><td style="padding: 2px 5px;">11</td><td style="padding: 2px 5px;">10</td><td style="padding: 2px 5px;">9</td><td style="padding: 2px 5px;">8</td><td style="padding: 2px 5px;">7</td><td style="padding: 2px 5px;">6</td><td style="padding: 2px 5px;">5</td><td style="padding: 2px 5px;">4</td><td style="padding: 2px 5px;">3</td><td style="padding: 2px 5px;">2</td><td style="padding: 2px 5px;">1</td><td style="padding: 2px 5px;">0</td> </tr> <tr> <td style="padding: 2px 5px;">1</td><td style="padding: 2px 5px;">1</td><td style="padding: 2px 5px;">1</td><td style="padding: 2px 5px;">1</td><td style="padding: 2px 5px;">0</td><td style="padding: 2px 5px;">1</td><td style="padding: 2px 5px;">S</td><td style="padding: 2px 5px;">D</td><td style="padding: 2px 5px;"> </td><td style="padding: 2px 5px;">1</td><td style="padding: 2px 5px;">0</td><td style="padding: 2px 5px;">0</td><td style="padding: 2px 5px;">0</td><td style="padding: 2px 5px;">0</td><td style="padding: 2px 5px;">1</td><td style="padding: 2px 5px;">0</td><td style="padding: 2px 5px;">1</td> </tr> </table>	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	1	1	1	1	0	1	S	D		1	0	0	0	0	1	0	1
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																			
1	1	1	1	0	1	S	D		1	0	0	0	0	1	0	1																		

**Execution** |(*src*)| → *dst* (or *src* if *dst* is not specified)

**Status Bits** OVM affects this instruction as follows:

If OVM = 1, the absolute value of 80 0000 0000h is 00 7FFF FFFFh.  
If OVM = 0, the absolute value of 80 0000 0000h is 80 0000 0000h.

Affects C and OVDst (or OVsrc, if *dst* = *src*)

**Description** This instruction calculates the absolute value of *src* and loads the value into *dst*. If no *dst* is specified, the absolute value is loaded into *src*.

If the result of the operation is equal to 0, the carry bit, C, is set.

**Words** 1 word

**Cycles** 1 cycle

**Classes** Class 1 (see page 3-3)

**Example 1** ABS A, B

		Before Instruction		After Instruction	
A		FF FFFF FFCB	-53	FF FFFF FFCB	-53
B		FF FFFF FC18	-1000	00 0000 0035	+53

**Example 2** ABS A

		Before Instruction		After Instruction	
A		03 1234 5678		00 7FFF FFFF	
OVM		1		1	

**Example 3** ABS A

		Before Instruction		After Instruction	
A		03 1234 5678		03 1234 5678	
OVM		0		0	

**Syntax**

- 1: **ADD** *Smem*, *src*
- 2: **ADD** *Smem*, **TS**, *src*
- 3: **ADD** *Smem*, **16**, *src* [, *dst* ]
- 4: **ADD** *Smem* [, *SHIFT*], *src* [, *dst* ]
- 5: **ADD** *Xmem*, *SHFT*, *src*
- 6: **ADD** *Xmem*, *Ymem*, *dst*
- 7: **ADD** **#lk** [, *SHFT*], *src* [, *dst* ]
- 8: **ADD** **#lk**, **16**, *src* [, *dst* ]
- 9: **ADD** *src* [, *SHIFT*], [, *dst* ]
- 10: **ADD** *src*, **ASM** [, *dst* ]

**Operands**

**Smem:** Single data-memory operand  
**Xmem, Ymem:** Dual data-memory operands  
**src, dst:** A (accumulator A)  
                   B (accumulator B)

$-32\ 768 \leq lk \leq 32\ 767$

$-16 \leq SHIFT \leq 15$

$0 \leq SHFT \leq 15$

**Opcode**

**Execution**

- 1: (Smem) + (src) → src
- 2: (Smem) << (TS) + (src) → src
- 3: (Smem) << 16 + (src) → dst
- 4: (Smem) [<< SHIFT] + (src) → dst
- 5: (Xmem) << SHFT + (src) → src
- 6: ((Xmem) + (Ymem)) << 16 → dst
- 7: lk << SHFT + (src) → dst
- 8: lk << 16 + (src) → dst
- 9: (src or [dst]) + (src) << SHIFT → dst
- 10: (src or [dst]) + (src) << ASM → dst

**Status Bits**

Affected by SXM and OVM

Affects C and OVdst (or OVsrc, if dst = src)

For instruction syntax 3, if the result of the addition generates a carry, the carry bit, C, is set to 1; otherwise, C is not affected.

**Description**

This instruction adds a 16-bit value to the content of the selected accumulator or to a 16-bit operand *Xmem* in dual data-memory operand addressing mode. The 16-bit value added is one of the following:

- The content of a single data-memory operand (*Smem*)
- The content of a dual data-memory operand (*Ymem*)
- A 16-bit immediate operand (*#Ik*)
- The shifted value in *src*

If *dst* is specified, this instruction stores the result in *dst*. If no *dst* is specified, this instruction stores the result in *src*. Most of the second operands can be shifted. For a left shift:

- Low-order bits are cleared
- High-order bits are:
  - Sign extended if *SXM* = 1
  - Cleared if *SXM* = 0

For a right shift, the high-order bits are:

- Sign extended if *SXM* = 1
- Cleared if *SXM* = 0

---

**Notes:**

The following syntaxes are assembled as a different syntax in certain cases.

- Syntax 4: If *dst* = *src* and *SHIFT* = 0, then the instruction opcode is assembled as syntax 1.
  - Syntax 4: If *dst* = *src*, *SHIFT* ≤ 15 and *Smem* indirect addressing mode is included in *Xmem*, then the instruction opcode is assembled as syntax 5.
  - Syntax 5: If *SHIFT* = 0, the instruction opcode is assembled as syntax 1.
- 

**Words**

Syntaxes 1, 2, 3, 5, 6, 9, and 10: 1 word  
Syntaxes 4, 7, and 8: 2 words

Add 1 word when using long-offset indirect addressing or absolute addressing with an *Smem*.

**Cycles**

Syntaxes 1, 2, 3, 5, 6, 9, and 10: 1 cycle  
Syntaxes 4, 7, and 8: 2 cycles

Add 1 cycle when using long-offset indirect addressing or absolute addressing with an *Smem*.

**Classes**

Syntaxes 1, 2, 3, and 5: Class 3A (see page 3-5)

Syntaxes 1, 2, and 3: Class 3B (see page 3-6)

Syntax 4: Class 4A (see page 3-7)

Syntax 4: Class 4B (see page 3-8)

Syntax 6: Class 7 (see page 3-12)

Syntaxes 7 and 8: Class 2 (see page 3-4)

Syntaxes 9 and 10: Class 1 (see page 3-3)

**Example 1**

ADD \*AR3+, 14, A

	Before Instruction	After Instruction
A	<input type="text" value="00 0000 1200"/>	<input type="text" value="00 0540 1200"/>
C	<input type="text" value="1"/>	<input type="text" value="0"/>
AR3	<input type="text" value="0100"/>	<input type="text" value="0101"/>
SXM	<input type="text" value="1"/>	<input type="text" value="1"/>
Data Memory		
0100h	<input type="text" value="1500"/>	<input type="text" value="1500"/>

**Example 2**

ADD A, -8, B

	Before Instruction	After Instruction
A	<input type="text" value="00 0000 1200"/>	<input type="text" value="00 0000 1200"/>
B	<input type="text" value="00 0000 1800"/>	<input type="text" value="00 0000 1812"/>
C	<input type="text" value="1"/>	<input type="text" value="0"/>

**Example 3**

ADD #4568, 8, A, B

	Before Instruction	After Instruction
A	<input type="text" value="00 0000 1200"/>	<input type="text" value="00 0000 1200"/>
B	<input type="text" value="00 0000 1800"/>	<input type="text" value="00 0045 7A00"/>
C	<input type="text" value="1"/>	<input type="text" value="0"/>

**Example 4**

ADD \*AR2+, \*AR2-, A ;after accessing the operands, AR2  
;is incremented by one.

Example 4 shows the same auxiliary register (AR2) with different addressing modes specified for both operands. The mode defined by the Xmod field (\*AR2+) is used for addressing.

**Syntax** **ADDC** *Smem, src*

**Operands** Smem: Single data-memory operand  
 src: A (accumulator A)  
 B (accumulator B)

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	1	1	S	I	A	A	A	A	A	A	A

**Execution** (Smem) + (src) + (C) → src

**Status Bits** Affected by OVM, C  
 Affects C and OVsrc

**Description** This instruction adds the 16-bit single data-memory operand *Smem* and the value of the carry bit (C) to *src*. This instruction stores the result in *src*. Sign extension is suppressed regardless of the value of the SXM bit.

**Words** 1 word

Add 1 word when using long-offset indirect addressing or absolute addressing with an Smem.

**Cycles** 1 cycle

Add 1 cycle when using long-offset indirect addressing or absolute addressing with an Smem.

**Classes** Class 3A (see page 3-5)  
 Class 3B (see page 3-6)

**Example** `ADDC *+AR2(5), A`

	Before Instruction	After Instruction
A	00 0000 0013	A 00 0000 0018
C	1	C 0
AR2	0100	AR2 0105
Data Memory		
0105h	0004	0105h 0004

**Syntax** **ADDM** #lk, Smem

**Operands** Smem: Single data-memory operand  
 $-32\,768 \leq lk \leq 32\,767$

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	1	1	0	1	0	1	1	I	A	A	A	A	A	A	A
16-bit constant															

**Execution** #lk + (Smem) → Smem

**Status Bits** Affected by OVM and SXM  
 Affects C and OVA

**Description** This instruction adds the 16-bit single data-memory operand *Smem* to the 16-bit immediate memory value *lk* and stores the result in *Smem*.

**Note:**

This instruction is not repeatable.

**Words** 2 words

Add 1 word when using long-offset indirect addressing or absolute addressing with an Smem.

**Cycles** 2 cycles

Add 1 cycle when using long-offset indirect addressing or absolute addressing with an Smem.

**Classes** Class 18A (see page 3-39)  
 Class 18B (see page 3-39)

**Example 1** `ADDM 0123Bh, *AR4+`

	Before Instruction	After Instruction
AR4	0100	0101
Data Memory		
0100h	0004	123F

**Example 2** `ADDM 0FFF8h, *AR4+`

	Before Instruction	After Instruction
OVM	1	1
SXM	1	1
AR4	0100	0101
Data Memory		
0100h	8007	8000

**Syntax** **ADDS** *Smem, src*

**Operands** Smem: Single data-memory operands  
 src: A (accumulator A)  
 B (accumulator B)

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	1	S	I	A	A	A	A	A	A	A

**Execution**  $\text{uns}(\text{Smem}) + (\text{src}) \rightarrow \text{src}$

**Status Bits** Affected by OVM  
 Affects C and OVsrc

**Description** This instruction adds the 16-bit single data-memory operand *Smem* to *src* and stores the result in *src*. Sign extension is suppressed regardless of the value of the SXM bit.

**Words** 1 word

Add 1 word when using long-offset indirect addressing or absolute addressing with an Smem.

**Cycles** 1 cycle

Add 1 cycle when using long-offset indirect addressing or absolute addressing with an Smem.

**Classes** Class 3A (see page 3-5)  
 Class 3B (see page 3-6)

**Example** `ADDS *AR2-, B`

	Before Instruction	After Instruction
B	00 0000 0003	00 0000 F009
C	x	0
AR2	0100	00FF
Data Memory		
0104h	F006	F006

**Syntax**

- 1: **AND** *Smem*, *src*
- 2: **AND** *#lk* [, *SHFT*], *src* [, *dst*]
- 3: **AND** *#lk*, **16**, *src* [, *dst*]
- 4: **AND** *src* [, *SHIFT*], [, *dst*]

**Operands**

*Smem*: Single data-memory operand  
*src*: A (accumulator A)  
 B (accumulator B)  
 $-16 \leq \text{SHIFT} \leq 15$   
 $0 \leq \text{SHFT} \leq 15$   
 $0 \leq lk \leq 65\,535$

**Opcode**

1:

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	1	1	0	0	S	I	A	A	A	A	A	A	A

2:

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	0	S	D	0	0	1	1	S	H	F	T
16-bit constant															

3:

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	0	S	D	0	1	1	0	0	0	1	1
16-bit constant															

4:

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	0	S	D	1	0	0	S	H	I	F	T

**Execution**

- 1: (*Smem*) AND (*src*) → *src*
- 2:  $lk \ll SHFT$  AND (*src*) → *dst*
- 3:  $lk \ll 16$  AND (*src*) → *dst*
- 4: (*dst*) AND (*src*)  $\ll$  SHIFT → *dst*

**Status Bits**

None

**Description**This instruction ANDs the following to *src*:

- A 16-bit operand *Smem*
- A 16-bit immediate operand *lk*
- The source or destination accumulator (*src* or *dst*)

If a shift is specified, this instruction left-shifts the operand before the AND. For a left shift, the low-order bits are cleared and the high-order bits are not sign extended. For a right shift, the high-order bits are not sign extended.

**Words**

Syntaxes 1 and 4: 1 word  
 Syntaxes 2 and 3: 2 words

Add 1 word when using long-offset indirect addressing or absolute addressing with an Smem.

**Cycles**

Syntaxes 1 and 4: 1 cycle  
 Syntaxes 2 and 3: 2 cycles

Add 1 cycle when using long-offset indirect addressing or absolute addressing with an Smem.

**Classes**

Syntax 1: Class 3A (see page 3-5)  
 Syntax 1: Class 3B (see page 3-6)  
 Syntaxes 2 and 3: Class 2 (see page 3-4)  
 Syntax 4: Class 1 (see page 3-3)

**Example 1**

AND \*AR3+, A

	<b>Before Instruction</b>	<b>After Instruction</b>
A	00 00FF 1200	A 00 0000 1000
AR3	0100	AR3 0101
Data Memory		
0100h	1500	0100h 1500

**Example 2**

AND A, 3, B

	<b>Before Instruction</b>	<b>After Instruction</b>
A	00 0000 1200	A 00 0000 1200
B	00 0000 1800	B 00 0000 1000

**Syntax** **ANDM** #*lk*, *Smem*

**Operands** *Smem*: Single data-memory operand  
 $0 \leq lk \leq 65\,535$

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	1	1	0	1	0	0	0	I	A	A	A	A	A	A	A
16-bit constant															

**Execution** *lk* AND (*Smem*) → *Smem*

**Status Bits** None

**Description** This instruction ANDs the 16-bit single data-memory operand *Smem* with a 16-bit long constant *lk*. The result is stored in the data-memory location specified by *Smem*.

**Note:**

This instruction is not repeatable.

**Words** 2 words

Add 1 word when using long-offset indirect addressing or absolute addressing with an *Smem*.

**Cycles** 2 cycles

Add 1 cycle when using long-offset indirect addressing or absolute addressing with an *Smem*.

**Classes** Class 18A (see page 3-39)  
 Class 18B (see page 3-39)

**Example 1** `ANDM #00FFh, *AR4+`

	Before Instruction	After Instruction
AR4	0100	0101
Data Memory		
0100h	0444	0044

**Example 2** `ANDM #0101h, 4; DP = 0`

	Before Instruction	After Instruction
Data Memory		
0004h	00 0000 0100	00 0000 0100

**Syntax**                    **B[D]** *pmad*

**Operands**                  $0 \leq pmad \leq 65\,535$

**Execution**                *pmad* → PC

**Status Bits**             None

**Description**            This instruction passes control to the designated program-memory address (*pmad*), which can be either a symbolic or numeric address. If the branch is delayed (specified by the D suffix), the two 1-word instructions or the one 2-word instruction following the branch instruction is fetched from program memory and executed.

**Note:**  
This instruction is not repeatable.

**Words**                    2 words

**Cycles**                   4 cycles  
2 cycles (delayed)

**Classes**                 Class 29A (see page 3-66)

**Example 1**                B 2000h

**Example 2**                BD 1000h  
ANDM 4444h, \*AR1+

After the operand has been ANDed with 4444h, the program continues executing from location 1000h.

**Syntax**            **BACC[D]** *src***Operands**            *src*:     A (accumulator A)  
                              B (accumulator B)**Opcode**                    15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0  
                              1 1 1 1 0 1 Z S | 1 1 1 0 0 0 1 0**Execution**            (*src*(15–0)) → PC**Status Bits**            None**Description**            This instruction passes control to the 16-bit address in the low part of *src* (bits 15–0). If the branch is delayed (specified by the D suffix), the two 1-word instructions or the one 2-word instruction following the branch instruction is fetched from program memory and executed.**Note:**

This instruction is not repeatable.

**Words**                 1 word**Cycles**                6 cycles  
                              4 cycles (delayed)**Classes**                Class 30A (see page 3-67)**Example 1**             BACC A

	Before Instruction	After Instruction
A	00 0000 3000	A 00 0000 3000
PC	1F45	PC 3000

**Example 2**BACCD B  
ANDM 4444h, \*AR1+

	Before Instruction	After Instruction
B	00 0000 2000	B 00 0000 2000
PC	1F45	PC 2000

After the operand has been ANDed with 4444h value, the program continues executing from location 2000h.

**Syntax** **BANZ[D]** *pmad*, *Sind*

**Operands** *Sind*: Single indirect addressing operand  
 $0 \leq pmad \leq 65\,535$

**Execution**

If  $((ARx) \neq 0)$   
 Then  
                      $pmad \rightarrow PC$

Else  
                      $(PC) + 2 \rightarrow PC$

**Status Bits** None

**Description** This instruction branches to the specified program-memory address (*pmad*) if the value of the current auxiliary register *ARx* is not 0. Otherwise, the PC is incremented by 2. If the branch is delayed (specified by the D suffix), the two 1-word instructions or the one 2-word instruction following the branch instruction is fetched from program memory and executed.

**Note:**  
 This instruction is not repeatable.

**Words** 2 words

**Cycles** 4 cycles (true condition)  
 2 cycles (false condition)  
 2 cycles (delayed)

**Classes** Class 29A (see page 3-66)

**Example 1** BANZ 2000h, \*AR3-

	Before Instruction	After Instruction
PC	1000	2000
AR3	0005	0004

**Example 2** BANZ 2000h, \*AR3-

	Before Instruction	After Instruction
PC	1000	1002
AR3	0000	FFFF

**Example 3**

BANZ 2000h, \*AR3(-1)

	Before Instruction	After Instruction
PC	<input type="text" value="1000"/>	<input type="text" value="1003"/>
AR3	<input type="text" value="0001"/>	<input type="text" value="0001"/>

**Example 4**

BANZD 2000h, \*AR3-

ANDM 4444h, \*AR5+

	Before Instruction	After Instruction
PC	<input type="text" value="1000"/>	<input type="text" value="2000"/>
AR3	<input type="text" value="0004"/>	<input type="text" value="0003"/>

After the memory location has been ANDed with 4444h, the program continues executing from location 2000h.

**Execution**

If (cond(s))  
 Then  
                    $pmad \rightarrow PC$   
 Else  
                    $(PC) + 2 \rightarrow PC$

**Status Bits**

Affects OVA or OVB if OV or NOV is chosen

**Description**

This instruction branches to the program-memory address (*pmad*) if the specified condition(s) is met. The two 1-word instructions or the one 2-word instruction following the branch instruction is fetched from program memory. If the condition(s) is met, the two words following the instruction are flushed from the pipeline and execution begins at *pmad*. If the condition(s) is not met, the PC is incremented by 2 and the two words following the instruction are executed.

If the branch is delayed (specified by the D suffix), the two 1-word instructions or the one 2-word instruction is fetched from program memory and executed. The two words following the delayed instruction have no effect on the conditions being tested. If the condition(s) is met, execution continues at *pmad*. If the condition(s) is not met, the PC is incremented by 2 and the two words following the delayed instruction are executed.

This instruction tests multiple conditions before passing control to another section of the program. This instruction can test the conditions individually or in combination with other conditions. You can combine conditions from only one group as follows:

- Group 1: You can select up to two conditions. Each of these conditions must be from a different category (category A or B); you cannot have two conditions from the same category. For example, you can test EQ and OV at the same time but you cannot test GT and NEQ at the same time. The accumulator must be the same for both conditions; you cannot test conditions for both accumulators with the same instruction. For example, you can test AGT and AOV at the same time, but you cannot test AGT and BOV at the same time.
- Group 2: You can select up to three conditions. Each of these conditions must be from a different category (category A, B, or C); you cannot have two conditions from the same category. For example, you can test TC, C, and BIO at the same time but you cannot test NTC, C, and NC at the same time.

**Conditions for This Instruction**

Group 1		Group 2		
Category A	Category B	Category A	Category B	Category C
EQ	OV	TC	C	BIO
NEQ	NOV	NTC	NC	NBIO
LT				
LEQ				
GT				
GEQ				

**Note:**

This instruction is not repeatable.

<b>Words</b>	2 words
<b>Cycles</b>	5 cycles (true condition) 3 cycles (false condition) 3 cycles (delayed)
<b>Classes</b>	Class 31A (see page 3-68)

**Example 1**

BC 2000h, AGT

	Before Instruction	After Instruction
A	00 0000 0053	00 0000 0053
PC	1000	2000

**Example 2**

BC 2000h, AGT

	Before Instruction	After Instruction
A	FF FFFF FFFF	FF FFFF FFFF
PC	1000	1002

**Example 3**

BCD 1000h, BOV  
ANDM 4444h, \*AR1+

	Before Instruction	After Instruction
PC	3000	1000
OVB	1	1

After the memory location is ANDed with 4444h, the branch is taken if the condition (OVB) is met. Otherwise, execution continues at the instruction following this instruction.

**Example 4**

BC 1000h, TC, NC, BIO

	Before Instruction	After Instruction
PC	3000	3002
C	1	1

**Syntax** **BIT** *Xmem*, *BITC*

**Operands** *Xmem*: Dual data-memory operand  
 $0 \leq \text{BITC} \leq 15$

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	0	0	1	0	1	1	0	X	X	X	X	B	I	T	C

**Execution** (*Xmem*(15 – *BITC*)) → TC

**Status Bits** Affects TC

**Description** This instruction copies the specified bit of the dual data-memory operand *Xmem* into the TC bit of status register ST0. The following table lists the bit codes that correspond to each bit in data memory.

The bit code corresponds to *BITC* and the bit address corresponds to (15 – *BITC*).

**Bit Codes for This Instruction**

Bit Address	Bit Code	Bit Address	Bit Code
(LSB) 0	1111	8	0111
1	1110	9	0110
2	1101	10	0101
3	1100	11	0100
4	1011	12	0011
5	1010	13	0010
6	1001	14	0001
7	1000	(MSB) 15	0000

**Words** 1 word

**Cycles** 1 cycle

**Classes** Class 3A (see page 3-5)

**Example** `BIT *AR5+, 15-12; test bit 12`

	Before Instruction	After Instruction
AR5	0100	0101
TC	0	1
Data Memory		
0100h	7688	7688

**Syntax**                    **BITF** *Smem*, #*lk*

**Operands**                *Smem*:    Single data-memory operand  
 $0 \leq lk \leq 65\,535$

**Execution**                If  $((Smem) \text{ AND } lk) = 0$   
 Then  
                                 0 → TC  
 Else  
                                 1 → TC

**Status Bits**              Affects TC

**Description**              This instruction tests the specified bit or bits of the data-memory value *Smem*. If the specified bit (or bits) is 0, the TC bit in status register ST0 is cleared to 0; otherwise, TC is set to 1. The *lk* constant is a mask for the bit or bits tested.

**Words**                     2 words  
  
 Add 1 word when using long-offset indirect addressing or absolute addressing with an *Smem*.

**Cycles**                    2 cycles  
  
 Add 1 cycle when using long-offset indirect addressing or absolute addressing with an *Smem*.

**Classes**                    Class 6A (see page 3-10)  
 Class 6B (see page 3-11)

**Example 1**                 **BITF** 5, 00FFh

**Example 2**                 **BITF** 5, 0800h

**Syntax** **BITT** *Smem***Operands** *Smem*: Single data-memory operand

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	1	1	0	1	0	0	I	A	A	A	A	A	A	A

**Execution** (*Smem* (15 – T(3–0))) → TC**Status Bits** Affects TC

**Description** This instruction copies the specified bit of the data-memory value *Smem* into the TC bit in status register ST0. The four LSBs of T contain a bit code that specifies which bit is copied.

The bit address corresponds to (15 – T(3–0)). The bit code corresponds to the content of T(3–0).

**Bit Codes for This Instruction**

Bit Address		Bit Code	Bit Address		Bit Code
(LSB)	0	1111	8	0111	
	1	1110	9	0110	
	2	1101	10	0101	
	3	1100	11	0100	
	4	1011	12	0011	
	5	1010	13	0010	
	6	1001	14	0001	
	7	1000	(MSB)	15	0000

**Words** 1 word

Add 1 word when using long-offset indirect addressing or absolute addressing with an *Smem*.

**Cycles** 1 cycle

Add 1 cycle when using long-offset indirect addressing or absolute addressing with an *Smem*.

**Classes** Class 3A (see page 3-5)  
Class 3B (see page 3-6)

**Example**

BITT \*AR7+0

	<b>Before Instruction</b>	<b>After Instruction</b>
T	<input type="text" value="C"/>	<input type="text" value="C"/>
TC	<input type="text" value="0"/>	<input type="text" value="1"/>
AR0	<input type="text" value="0008"/>	<input type="text" value="0008"/>
AR7	<input type="text" value="0100"/>	<input type="text" value="0108"/>
Data Memory		
0100h	<input type="text" value="0008"/>	0100h <input type="text" value="0008"/>

**Syntax** CALA[D] *src*

**Operands** src: A (accumulator A)  
B (accumulator B)

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	1	Z	S	1	1	1	0	0	0	1	1

**Execution**

**Nondelayed**  
 (SP) - 1 → SP  
 (PC) + 1 → TOS  
 (src(15-0)) → PC

**Delayed**  
 (SP) - 1 → SP  
 (PC) + 3 → TOS  
 (src(15-0)) → PC

**Status Bits** None

**Description** This instruction passes control to the 16-bit address in the low part of *src* (bits 15-0). If the call is delayed (specified by the D suffix), the two 1-word instructions or the one 2-word instruction following the call instruction is fetched from program memory and executed.

**Note:**

This instruction is not repeatable.

**Words** 1 word

**Cycles** 6 cycles  
4 cycles (delayed)

**Classes** Class 30B (see page 3-67)

**Example 1** CALA A

	Before Instruction		After Instruction
A	00 0000 3000		00 0000 3000
PC	0025		3000
SP	1111		1110
Data Memory			
1110h	4567		0026

**Example 2**

```
CALAD B
ANDM 4444h, *AR1+
```

	Before Instruction		After Instruction
B	00 0000 2000	B	00 0000 2000
PC	0025	PC	2000
SP	1111	SP	1110
Data Memory			
1110h	4567	1110h	0028

After the memory location has been ANDed with 4444h, the program continues executing from location 2000h.

**Syntax** **CALL[D]** *pmad*

**Operands**  $0 \leq pmad \leq 65\,535$

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	0	Z	0	0	1	1	1	0	1	0	0
16-bit constant															

**Execution**

**Nondelayed**  
 (SP) – 1 → SP  
 (PC) + 2 → TOS  
*pmad* → PC

**Delayed**  
 (SP) – 1 → SP  
 (PC) + 4 → TOS  
*pmad* → PC

**Status Bits** None

**Description** This instruction passes control to the specified program-memory address (*pmad*). The return address is pushed onto the TOS before *pmad* is loaded into PC. If the call is delayed (specified by the D suffix), the two 1-word instructions or the one 2-word instruction following the call instruction is fetched from program memory and executed.

**Note:**

This instruction is not repeatable.

**Words** 2 words

**Cycles** 4 cycles  
 2 cycles (delayed)

**Classes** Class 29B (see page 3-66)

**Example 1**

CALL 3333h

	<b>Before Instruction</b>	<b>After Instruction</b>

Then

 $(SP) - 1 \rightarrow SP$  $(PC) + 4 \rightarrow TOS$  $pmad \rightarrow PC$ 

Else

 $(PC) + 2 \rightarrow PC$ **Status Bits**

Affects OVA or OVB (if OV or NOV is chosen)

**Description**

This instruction passes control to the program-memory address (*pmad*) if the specified condition(s) is met. The two 1-word instructions or the one 2-word instruction following the call instruction is fetched from program memory. If the condition(s) is met, the two words following the instruction are flushed from the pipeline and execution begins at *pmad*. If the condition(s) is not met, the PC is incremented by 2 and the two words following the instruction are executed.

If the call is delayed (specified by the D suffix), the two 1-word instructions or the one 2-word instruction is fetched from program memory and executed. The two words following the delayed instruction have no effect on the conditions being tested. If the condition(s) is met, execution continues at *pmad*. If the condition(s) is not met, the PC is incremented by 2 and the two words following the delayed instruction are executed.

This instruction tests multiple conditions before passing control to another section of the program. This instruction can test the conditions individually or in combination with other conditions. You can combine conditions from only one group as follows:

Group1: You can select up to two conditions. Each of these conditions must be from a different category (category A or B); you cannot have two conditions from the same category. For example, you can test EQ and OV at the same time but you cannot test GT and NEQ at the same time. The accumulator must be the same for both conditions; you cannot test conditions for both accumulators with the same instruction. For example, you can test AGT and AOV at the same time, but you cannot test AGT and BOV at the same time.

Group 2: You can select up to three conditions. Each of these conditions must be from a different category (category A, B, or C); you cannot have two conditions from the same category. For example, you can test TC, C, and BIO at the same time but you cannot test NTC, C, and NC at the same time.

## Conditions for This Instruction

Group 1		Group 2		
Category A	Category B	Category A	Category B	Category C
EQ	OV	TC	C	BIO
NEQ	NOV	NTC	NC	NBIO
LT				
LEQ				
GT				
GEQ				

**Note:**

This instruction is not repeatable.

**Words**

2 words

**Cycles**

5 cycles (true condition)  
 3 cycles (false condition)  
 3 cycles (delayed)

**Classes**

Class 31B (see page 3-69)

**Example 1**

CC 2222h, AGT

	Before Instruction		After Instruction
A	<input type="text" value="00 0000 3000"/>	A	<input type="text" value="00 0000 3000"/>
PC	<input type="text" value="0025"/>	PC	<input type="text" value="2222"/>
SP	<input type="text" value="1111"/>	SP	<input type="text" value="1110"/>
Data Memory			
1110h	<input type="text" value="4567"/>	1110h	<input type="text" value="0027"/>

**Example 2**

CCD 1000h, BOV  
 ANDM 4444h, \*AR1+

	Before Instruction		After Instruction
PC	<input type="text" value="0025"/>	PC	<input type="text" value="1000"/>
OV B	<input type="text" value="1"/>	OV B	<input type="text" value="0"/>
SP	<input type="text" value="1111"/>	SP	<input type="text" value="1110"/>
Data Memory			
1110h	<input type="text" value="4567"/>	1110h	<input type="text" value="0029"/>

After the memory location has been ANDed with 4444h, the program continues executing from location 1000h.

**Syntax** **CMPL** *src* [, *dst* ]

**Operands** *src*, *dst*: A (accumulator A)  
B (accumulator B)

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	1	S	D	1	0	0	1	0	0	1	1

**Execution**  $\overline{(\text{src})} \rightarrow \text{dst}$

**Status Bits** None

**Description** This instruction calculates the 1s complement of the content of *src* (this is a logical inversion). The result is stored in *dst*, if specified, or *src* otherwise.

**Words** 1 word

**Cycles** 1 cycle

**Classes** Class 1 (see page 3-3)

**Example** CMPL A, B

	Before Instruction		After Instruction
A	FC DFFA AEAA	A	FC DFFA AEAA
B	00 0000 7899	B	03 2005 5155

**Syntax** **CMPM** *Smem*, #*lk*

**Operands** *Smem*: Single data-memory operand  
 $-32\,768 \leq lk \leq 32\,767$

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	1	1	0	0	0	0	0	I	A	A	A	A	A	A	A
16-bit constant															

**Execution** If (*Smem*) = *lk*  
 Then  
     1 → TC  
 Else  
     0 → TC

**Status Bits** Affects TC

**Description** This instruction compares the 16-bit single data-memory operand *Smem* to the 16-bit constant *lk*. If they are equal, TC is set to 1. Otherwise, TC is cleared to 0.

**Words** 2 words

Add 1 word when using long-offset indirect addressing or absolute addressing with an *Smem*.

**Cycles** 2 cycles

Add 1 cycle when using long-offset indirect addressing or absolute addressing with an *Smem*.

**Classes** Class 6A (see page 3-10)  
 Class 6B (see page 3-11)

**Example** `CMPM *AR4+, 0404h`

	Before Instruction	After Instruction
TC	1	0
AR4	0100	0101
Data Memory		
0100h	4444	4444

**Syntax** **CMPR** *CC*, *ARx*

**Operands**  $0 \leq CC \leq 3$   
*ARx*: AR0–AR7

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	1	C	C	1	0	1	0	1	A	R	X

**Execution** If (cond)  
 Then  
     1 → TC  
 Else  
     0 → TC

**Status Bits** Affects TC

**Description** This instruction compares the content of the designated auxiliary register (*ARx*) to the content of AR0 and sets the TC bit according to the comparison. The comparison is specified by the *CC* (condition code) value (see the following table). If the condition is true, TC is set to 1. If the condition is false, TC is cleared to 0. All conditions are computed as unsigned operations.

Condition	Condition Code (CC)	Description
EQ	00	Test if (ARx) = (AR0)
LT	01	Test if (ARx) < (AR0)
GT	10	Test if (ARx) > (AR0)
NEQ	11	Test if (ARx) ≠ (AR0)

**Words** 1 word

**Cycles** 1 cycle

**Classes** Class 1 (see page 3-3)

**Example** CMPR 2, AR4

		Before Instruction		After Instruction
TC		1	TC	0
AR0		FFFF	AR0	FFFF
AR4		7FFF	AR4	7FFF

<b>Syntax</b>	<b>CMPS</b> <i>src</i> , <i>Smem</i>																																
<b>Operands</b>	src:       A (accumulator A) B (accumulator B) Smem:     Single data-memory operand																																
<b>Opcode</b>	<table border="1" style="border-collapse: collapse; text-align: center; width: 100%;"> <tr> <td>15</td><td>14</td><td>13</td><td>12</td><td>11</td><td>10</td><td>9</td><td>8</td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td> </tr> <tr> <td>1</td><td>0</td><td>0</td><td>0</td><td>1</td><td>1</td><td>1</td><td>S</td><td>I</td><td>A</td><td>A</td><td>A</td><td>A</td><td>A</td><td>A</td><td>A</td> </tr> </table>	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	1	0	0	0	1	1	1	S	I	A	A	A	A	A	A	A
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

<b>Execution</b>	<p>If ((src(31–16)) &gt; (src(15–0))) Then            (src(31–16)) → Smem            (TRN) &lt;&lt; 1 → TRN            0 → TRN(0)            0 → TC</p> <p>Else            (src(15–0)) → Smem            (TRN) &lt;&lt; 1 → TRN            1 → TRN(0)            1 → TC</p>																																
<b>Status Bits</b>	Affects TC																																
<b>Description</b>	<p>This instruction compares the two 16-bit 2s-complement values located in the high and low parts of <i>src</i> and stores the maximum value in the single data-memory location <i>Smem</i>. If the high part of <i>src</i> (bits 31–16) is greater, a 0 is shifted into the LSB of the transition register (TRN) and the TC bit is cleared to 0. If the low part of <i>src</i> (bits 15–0) is greater, a 1 is shifted into the LSB of TRN and the TC bit is set to 1.</p> <p>This instruction does not follow the standard pipeline operation. The comparison is performed in the read phase; thus, the <i>src</i> value is the value one cycle before the instruction executes. TRN and the TC bit are updated during the execution phase.</p>																																
<b>Words</b>	<p>1 word</p> <p>Add 1 word when using long-offset indirect addressing or absolute addressing with an Smem.</p>

0000				
6CAC				

**Syntax** **DLD** *Lmem, dst*

**Operands** Lmem: Long data-memory operand  
 dst: A (accumulator A)  
 B (accumulator B)

**Execution** If C16 = 0  
 Then  
 (Lmem) → dst  
 Else  
 (Lmem(31–16)) → dst(39–16)  
 (Lmem(15–0)) → dst(15–0)

**Status Bits** Affected by SXM

**Description** This instruction loads *dst* with a 32-bit long operand *Lmem*. The value of C16 determines the mode of the instruction:

- If C16 = 0, the instruction is executed in double-precision mode. *Lmem* is loaded to *dst*.
- If C16 = 1, the instruction is executed in dual 16-bit mode. The 16 MSBs of *Lmem* are loaded to the upper 24 bits of *dst*. At the same time, the 16 LSBs of *Lmem* are loaded in the lower 16 bits of *dst*.

**Words** 1 word  
 Add 1 word when using long-offset indirect addressing or absolute addressing with an Lmem.

**Cycles** 1 cycle  
 Add 1 cycle when using long-offset indirect addressing or absolute addressing with an Lmem.

**Classes** Class 9A (see page 3-20)  
 Class 9B (see page 3-21)

**Example** DLD \*AR3+, B

	Before Instruction	After Instruction

† Because this instruction is a long-operand instruction, AR3 is decremented by 2 after the execution.

**Syntax** **DSUB** *Lmem, src*

**Operands**  
*Lmem*: Long data-memory operand  
*src*: A (accumulator A)  
       B (accumulator B)

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	1	0	1	0	1	0	S	I	A	A	A	A	A	A	A

**Execution**  
 If C16 = 0  
 Then  
     (*src*) – (*Lmem*) → *src*  
 Else  
     (*src*(31–16)) – (*Lmem*(31–16)) → *src*(39–16)  
     (*src*(15–0)) – (*Lmem*(15–0)) → *src*(15–0)

**Status Bits**  
 Affected by SXM and OVM (only if C16 = 0)  
 Affects C and OV*src*

**Description**  
 This instruction subtracts the 32-bit long data-memory operand *Lmem* from the content of *src*, and stores the result in *src*. The value of C16 determines the mode of the instruction:

- If C16 = 0, the instruction is executed in double-precision mode. *Lmem* is subtracted from the content of *src*.
- If C16 = 1, the instruction is executed in dual 16-bit mode. The 16 MSBs of *Lmem* are subtracted from the high part of *src* (bits 31–16) and the result is stored in the high part of *src* (bits 39–16). At the same time, the 16 LSBs of *Lmem* are subtracted from the low part of *src* (bits 15–0) and the result is stored in the low part of *src* (bits 15–0).

**Words** 1 word

Add 1 word when using long-offset indirect addressing or absolute addressing with an *Lmem*.

**Cycles** 1 cycle

Add 1 cycle when using long-offset indirect addressing or absolute addressing with an *Lmem*.

**Classes**  
 Class 9A (see page 3-20)  
 Class 9B (see page 3-21)

**Example 1**

0100h	1534	0100h 1534
0101h	3456	0101h 3456

† Because this instruction is a long-operand instruction, AR3 is decremented by 2 after the execution.

**Syntax** **DSUBT** *Lmem, dst*

**Operands** *Lmem*: Long data-memory operand  
*dst*: A (accumulator A)  
 B (accumulator B)

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	1	0	1	1	1	0	D	I	A	A	A	A	A	A	A

**Execution** If C16 = 1  
 Then  
 $(Lmem(31-16)) - (T) \rightarrow dst(39-16)$   
 $(Lmem(15-0)) - (T) \rightarrow dst(15-0)$   
 Else  
 $(Lmem) - ((T) + (T \ll 16)) \rightarrow dst$

**Status Bits** Affected by SXM and OVM (only if C16 = 0)  
 Affects C and OVdst

**Description** This instruction subtracts the content of T from the 32-bit long data-memory operand *Lmem* and stores the result in *dst*. The value of C16 determines the mode of the instruction:

- If C16 = 0, the instruction is executed in double-precision mode. A 32-bit value composed of the content of T concatenated with the content of T left-shifted 16 bits ( $T \ll 16 + T$ ) is subtracted from *Lmem*. The result is stored in *dst*.
- If C16 = 1, the instruction is executed in dual 16-bit mode. The content of T is subtracted from the 16 MSBs of *Lmem* and the result is stored in the high part of *dst* (bits 39–16). At the same time, the content of T is subtracted from the 16 LSBs of *Lmem* and the result is stored in the low part of *dst* (bits 15–0). In this mode, the results are not saturated regardless of the value of the OVM bit.

**Note:**

This instruction is meaningful only if C16 is set to 1 (dual 16-bit mode).

**Words** 1 word

Add 1 word when using long-offset indirect addressing or absolute addressing with an *Lmem*.

**Cycles** 1 cycle

Add 1 cycle when using long-offset indirect addressing or absolute addressing with an *Lmem*.

**Classes**

Class 9A (see page 3-20)

Class 9B (see page 3-21)

† Because this instruction is a long operand instruction, AR3 is decremented by 2 after the execution.

**Syntax**                    **EXP** *src*

**Operands**                *src*:     A (accumulator A)  
     B (accumulator B)

**Opcode**                    15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0  

1	1	1	1	0	1	0	S	1	0	0	0	1	1	1	0
---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---

**Execution**                If (*src*) = 0  
     Then  
     0 → T  
     Else  
     (Number of leading bits of *src*) – 8 → T

**Status Bits**                None

**Description**                This instruction computes the exponent value, which is a signed 2s-complement value in the –8 to 31 range, and stores the result in T. The exponent is computed by calculating the number of leading bits in *src* and subtracting 8 from this value. The number of leading bits is equivalent to the number of left shifts needed to eliminate the significant bits from the 40-bit *src* with the exception of the sign bit. The *src* is not modified after this instruction.

The result of subtracting 8 from the number of leading bits produces a negative exponent for accumulator values that have significant bits in the guard bits (the eight MSBs of the accumulator used in error detection and correction). See the normalization instruction (page 4-122).

**Words**                        1 word

**Cycles**                        1 cycle

**Classes**                        Class 1 (see page 3-3)

**Example 1**                    EXP A

	Before Instruction		After Instruction
A	FF FFFF FFCB	–53	FF FFFF FFCB    –53

	16-bit constant = $\text{pmad}(15-0)$															

**Execution**  
 $\text{pmad}(15-0) \rightarrow \text{PC}$   
 $\text{pmad}(22-16) \rightarrow \text{XPC}$ **Status Bits** None**Description**  
This instruction passes control to the program-memory address *pmad* (bits 15–0) on the page specified by *pmad* (bits 22–16). The *pmad* can be either a symbolic or numeric address. If the branch is delayed (specified by the D suffix), the two 1-word instructions or the one 2-word instruction following the branch instruction is fetched from program memory and executed.**Note:**

This instruction is not repeatable. This instruction cannot be included in a block repeat (RPTB) instruction.

**Words** 2 words**Cycles** 4 cycles  
2 cycles (delayed)**Classes** Class 29A (see page 3-66)**Example 1** `FB 012000h`

	Before Instruction		After Instruction
PC	1000	PC	2000
XPC	00	XPC	01

2000h is loaded into the PC, 01h is loaded into XPC, and the program continues executing from that location.

**Example 2**

```
FBD 7F1000h
ANDM #4444h, *AR1+
```

	Before Instruction		After Instruction
PC	2000	PC	1000
XPC	00	XPC	7F

After the operand has been ANDed with 4444h, the program continues executing from location 1000h on page 7Fh.

**Syntax**                    **FBACC[D]** *src*

**Operands**                *src*:     A (accumulator A)  
     B (accumulator B)

**Opcode**

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	1	1	1	1	0	1	Z	S	1	1	1	0	0	1	1	0

**Execution**                (*src*(15–0)) → PC  
     (*src*(22–16)) → XPC

**Status Bits**              None

**Description**             This instruction loads the XPC with the value in *src* (bits 22–16) and passes control to the 16-bit address in the low part of *src* (bits 15–0). If the branch is delayed (specified by the D suffix), the two 1-word instructions or the one 2-word instruction following the branch instruction is fetched from program memory and executed.

**Note:**

This instruction is not repeatable. This instruction cannot be included in a block repeat (RPTB) instruction.

**Words**                     1 word

**Cycles**                    6 cycles  
     4 cycles (delayed)

**Classes**                  Class 30A (see page 3-67)

**Example 1**                `FBACC A`

	<b>Before Instruction</b>		<b>After Instruction</b>
A	00 0001 3000	A	00 0001 3000
PC	1000	PC	3000
XPC	00	XPC	01

1h is loaded into the XPC, 3000h is loaded into the PC, and the program continues executing from that location on page 1h.

**Example 2**                `FBACCD B`

`ANDM 4444h *AR1+`

	<b>Before Instruction</b>		<b>After Instruction</b>
B	00 007F 2000	B	00 007F 2000
XPC	01	XPC	7F

After the operand has been ANDed with 4444h value, 7Fh is loaded into the XPC, and the program continues executing from location 2000h on page 7Fh.

**Syntax**                    **FCALA[D] src**

**Operands**                src:    A (accumulator A)  
     B (accumulator B)

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	1	Z	S	1	1	1	0	0	1	1	1

ANDM #4444h, \*AR1+

	Before Instruction	After Instruction
PC	3001	1000
XPC	7F	30
SP	1111	110F
Data Memory		
1110h	4567	3005
110Fh	4567	007F

After the memory location has been ANDed with 4444h, the program continues executing from location 1000h.

**Syntax** **FIRS** *Xmem*, *Ymem*, *pmad*

**Operands** *Xmem*, *Ymem*: Dual data-memory operands  
 $0 \leq pmad \leq 65\,535$

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	0	0	0	0	0	X	X	X	X	Y	Y	Y	Y
16-bit constant															

**Execution** *pmad* → PAR  
While (RC) ≠ 0  
 $(B) + (A(32-16)) \times (\text{Pmem addressed by PAR}) \rightarrow B$   
 $((Xmem) + (Ymem)) \ll 16 \rightarrow A$   
 $(PAR) + 1 \rightarrow PAR$   
 $(RC) - 1 \rightarrow RC$

**Status Bits** Affected by SXM, FRCT, and OVM  
Affects C, OVA, and OVB

**Description** This instruction implements a symmetrical finite impulse response (FIR) filter. This instruction multiplies accumulator A (bits 32–16) with a Pmem value addressed by *pmad* (in the program address register PAR) and adds the result to the value in accumulator B. At the same time, it adds the memory operands *Xmem* and *Ymem*, shifts the result left 16 bits, and loads this value into accumulator A. In the next iteration, *pmad* is incremented by 1. Once the repeat pipeline is started, the instruction becomes a single-cycle instruction.

**Words** 2 words

**Cycles** 3 cycles

**Classes** Class 8 (see page 3-15)

**Example** `FIRS *AR3+, *AR4+, COEFFS`

	Before Instruction	After Instruction
A	00 0077 0000	00 00FF 0000
B	00 0000 0000	00 0008 762C
FRCT	0	0
AR3	0100	0101
AR4	0200	0201
Data Memory		
0100h	0055	0055
0200h	00AA	00AA
Program Memory		
COEFFS	1234	1234

**Syntax**                    **FRAME** *K*  
**Operands**                  $-128 \leq K \leq 127$

**Execution**                 $(SP) + K \rightarrow SP$

**Status Bits**             None

**Description**            This instruction adds a short-immediate offset *K* to the SP. There is no latency for address generation in compiler mode (CPL = 1) or for stack manipulation by the instruction following this instruction.

**Words**                    1 word

**Cycles**                   1 cycle

**Classes**                 Class 1 (see page 3-3)

**Example**                 `FRAME 10h`

**Syntax** FRET[D]**Operands** None

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	1	Z	0	1	1	1	0	0	1	0	0

**Execution**

(TOS) → XPC  
 (SP) + 1 → SP  
 (TOS) → PC  
 (SP) + 1 → SP

**Status Bits** None

**Description**

This instruction replaces the XPC with the 7-bit value from the TOS and replaces the PC with the next 16-bit value on the stack. The SP is incremented by 1 for each of the two replacements. If the return is delayed (specified by the D suffix), the two 1-word instructions or one 2-word instruction following this instruction is fetched and executed.

**Note:**

This instruction is not repeatable.

**Words** 1 word

**Cycles**

6 cycles  
 4 cycles (delayed)

**Classes** Class 34 (see page 3-71)**Example** FRET

	Before Instruction	After Instruction
PC	<input type="text" value="2112"/>	<input type="text" value="1000"/>
XPC	<input type="text" value="01"/>	<input type="text" value="05"/>
SP	<input type="text" value="0300"/>	<input type="text" value="0302"/>
Data Memory		
0300h	<input type="text" value="0005"/>	0300h <input type="text" value="0005"/>
0301h	<input type="text" value="1000"/>	0301h <input type="text" value="1000"/>

**Syntax**                    **FRETE[D]**

**Operands**                 None

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	1	Z	0	1	1	1	0	0	1	0	1

**Execution**

(TOS) → XPC  
 (SP) + 1 → SP  
 (TOS) → PC  
 (SP) + 1 → SP  
 0 → INTM

**Status Bits**             Affects INTM

**Description**

This instruction replaces the XPC with the 7-bit value from the TOS and replaces the PC with the next 16-bit value on the stack, continuing execution from the new PC value. This instruction automatically clears the interrupt mask bit (INTM) in ST1. (Clearing this bit enables interrupts.) If the return is delayed (specified by the D suffix), the two 1-word instructions or one 2-word instruction following this instruction is fetched and executed.

**Note:**

This instruction is not repeatable.

**Words**                    1 word

**Cycles**                 6 cycles  
 4 cycles (delayed)

**Classes**                Class 34 (see page 3-71)

**Example**                FRETE

<b>If K is:</b>	<b>NN is:</b>
1	00
2	10
3	01

**Execution**

(PC) +1 → PC

**Status Bits**

Affected by INTM

**Description**

This instruction forces the program being executed to wait until an unmasked interrupt or reset occurs. The PC is incremented by 1. The device remains in an idle state (power-down mode) until it is interrupted.

The idle state is exited after an unmasked interrupt, even if INTM = 1. If INTM = 1, the program continues executing at the instruction following the idle. If INTM = 0, the program branches to the corresponding interrupt service routine. The interrupt is enabled by the interrupt mask register (IMR), regardless of the INTM value. The following options, indicated by the value of K, determine the type of interrupts that can release the device from idle:

- K = 1      Peripherals, such as the timer and the serial ports, are still active. The peripheral interrupts as well as reset and external interrupts release the processor from idle mode.
- K = 2      Peripherals, such as the timer and the serial ports, are inactive. Reset and external interrupts release the processor from idle mode. Because interrupts are not latched in idle mode as they are in normal device operation, they must be low for a number of cycles to be acknowledged.
- K = 3      Peripherals, such as the timer and the serial ports, are inactive and the PLL is halted. Reset and external interrupts release the processor from idle mode. Because interrupts are not latched in idle mode as they are in normal device operation, they must be low for a number of cycles to be acknowledged.

**Note:**

This instruction is not repeatable.

**Words** 1 word

**Cycles** The number of cycles needed to execute this instruction depends on the idle period. Because the entire device is halted when  $K = 3$ , the number of cycles cannot be specified. The minimum number of cycles is 4.

**Classes** Class 36 (see page 3-72)

**Example 1** IDLE 1

The processor idles until a reset or unmasked interrupt occurs.

**Example 2** IDLE 2

The processor idles until a reset or unmasked external interrupt occurs.

**Example 3** IDLE 3

The processor idles until a reset or unmasked external interrupt occurs.

**Syntax**            **INTR K****Operands**             $0 \leq K \leq 31$ 

**Opcode**

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	1	1	1	1	0	1	1	1	1	1	0	K	K	K	K	K

**Execution**

(SP) – 1 → SP  
(PC) + 1 → TOS  
interrupt vector specified by K → PC  
1 → INTM

**Status Bits**            Affects INTM and IFR

**Description**

This instruction transfers program control to the interrupt vector specified by *K*. This instruction allows you to use your application software to execute any interrupt service routine. For a list of interrupts and their corresponding *K* value, see your device datasheet.

During execution of the instruction, the PC is incremented by 1 and pushed onto the TOS. Then, the interrupt vector specified by *K* is loaded in the PC and the interrupt service routine for this interrupt is executed. The corresponding bit in the interrupt flag register (IFR) is cleared and interrupts are globally disabled (INTM = 1). The interrupt mask register (IMR) has no effect on the INTR instruction. INTR is executed regardless of the value of INTM.

**Note:**

This instruction is not repeatable.

**Words**                    1 word**Cycles**                    3 cycles**Classes**                    Class 35 (see page 3-72)**Example**                    INTR 3

- 4: (Smem) << SHIFT → dst
- 5: (Xmem) << SHFT → dst
- 6: K → dst
- 7: lk << SHFT → dst
- 8: lk << 16 → dst
- 9: (src) << ASM → dst
- 10: (src) << SHIFT → dst

**Status Bits**

Affected by SXM in all accumulator loads

Affected by OVM in loads with SHIFT or ASM shift

Affects OVdst (or OVsrc, when dst = src) in loads with SHIFT or ASM shift

**Description**

This instruction loads the accumulator (*dst*, or *src* if *dst* is not specified) with a data-memory value or an immediate value, supporting different shift quantities. Additionally, the instruction supports accumulator-to-accumulator moves with shift.

**Notes:**

The following syntaxes are assembled as a different syntax in certain cases.

- Syntax 4: If *SHIFT* = 0, the instruction opcode is assembled as syntax 1.
- Syntax 4: If  $0 < SHIFT \leq 15$  and Smem indirect addressing mode is included in Xmem, the instruction opcode is assembled as syntax 5.
- Syntax 5: If *SHIFT* = 0, the instruction opcode is assembled as syntax 1.
- Syntax 7: If *SHIFT* = 0 and  $0 \leq Ik \leq 255$ , the instruction opcode is assembled as syntax 6.

**Words**

Syntaxes 1, 2, 3, 5, 6, 9, and 10: 1 word  
 Syntaxes 4, 7, and 8: 2 words

Add 1 word when using long-offset indirect addressing or absolute addressing with an Smem.

**Cycles**

Syntaxes 1, 2, 3, 5, 6, 9, and 10: 1 cycle  
 Syntaxes 4, 7, and 8: 2 cycles

Add 1 cycle when using long-offset indirect addressing or absolute addressing with an Smem.

**Classes**

Syntaxes 1, 2, 3, and 5: Class 3A (see page 3-5)  
 Syntaxes 1, 2, and 3: Class 3B (see page 3-6)  
 Syntax 4: Class 4A (see page 3-7)  
 Syntax 4: Class 4B (see page 3-8)  
 Syntaxes 6, 9, and 10: Class 1 (see page 3-3)  
 Syntaxes 7 and 8: Class 2 (see page 3-4)

**Execution**                 (*Xmem*) << 16 → *dst* (31–16)  
 If (Rounding)  
     Round (((*Ymem*) × (T)) + (*dst\_*)) → *dst\_*  
 Else  
     ((*Ymem*) × (T)) + (*dst\_*) → *dst\_*

**Status Bits**             Affected by SXM, FRCT, and OVM  
 Affects OV*dst\_*

**Description**            This instruction loads the high part of *dst* (bits 31–16) with a 16-bit dual data-memory operand *Xmem* shifted left 16-bits. In parallel, this instruction multiplies a dual data-memory operand *Ymem* by the content of T, adds the result of the multiplication to *dst\_*, and stores the result in *dst\_*.

If you use the R suffix, this instruction optionally rounds the result of the multiply and accumulate operation by adding  $2^{15}$  to the result and clearing the LSBs (15–0) to 0, and stores the result in *dst\_*.

0200h	4321	4321

**Syntax**                    **LDR** *Smem, dst*

**Operands**                *Smem*:    Single data-memory operand  
                               *dst*:        A (accumulator A)  
     B (accumulator B)

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	1	0	1	1	D	I	A	A	A	A	A	A	A

**Execution**                (*Smem*) << 16 + 1 << 15 → *dst*(31–16)

**Status Bits**             Affected by SXM

**Description**            This instruction loads the data-memory value *Smem* shifted left 16 bits into the high part of *dst* (bits 31–16). *Smem* is rounded by adding 2<sup>15</sup> to this value and clearing the 15 LSBs (14–0) of the accumulator to 0. Bit 15 of the accumulator is set to 1.

**Words**                    1 word

Add 1 word when using long-offset indirect addressing or absolute addressing with an *Smem*.

**Cycles**                    1 cycle

Add 1 cycle when using long-offset indirect addressing or absolute addressing with an *Smem*.

**Classes**                 Class 3A (see page 3-5)  
                                   Class 3B (see page 3-6)

**Example**                 LDR \*AR1, A

	Before Instruction	After Instruction
A	00 0000 0000	00 FEDC 8000
SXM	0	0
AR1	0200	0200
Data Memory		
0200h	FEDC	FEDC

**Syntax** `LDU Smem, dst`**Operands**  
Smem: Single data-memory operand  
dst: A (accumulator A)  
B (accumulator B)**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	1	0	0	1	D	I	A	A	A	A	A	A	A

**Execution**  
(Smem) → dst(15–0)  
00 0000h → dst(39–16)**Status Bits** None**Description**  
This instruction loads the data-memory value *Smem* into the low part of *dst* (bits 15–0). The guard bits and the high part of *dst* (bits 39–16) are cleared to 0. Data is then treated as an unsigned 16-bit number. There is no sign extension regardless of the status of the SXM bit.**Words** 1 word

Add 1 word when using long-offset indirect addressing or absolute addressing with an Smem.

**Cycles** 1 cycle

Add 1 cycle when using long-offset indirect addressing or absolute addressing with an Smem.

**Classes**  
Class 3A (see page 3-5)  
Class 3B (see page 3-6)**Example** `LDU *AR1, A`

	Before Instruction	After Instruction		
A	<table border="1"><tr><td>00 0000 0000</td></tr></table>	00 0000 0000	<table border="1"><tr><td>00 0000 FEDC</td></tr></table>	00 0000 FEDC

**Syntax**                    **LMS** *Xmem, Ymem*

**Operands**                *Xmem, Ymem*:     Dual data-memory operands

**Opcode**

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	1	1	1	0	0	0	0	1	X	X	X	X	Y	Y	Y	Y

**Execution**                (A) + (*Xmem*) << 16 + 2<sup>15</sup> → A  
 (B) + (*Xmem*) × (*Ymem*) → B

**Status Bits**              Affected by SXM, FRCT, and OVM  
 Affects C, OVA, and OVB

**Description**             This instruction executes the least mean square (LMS) algorithm. The dual data-memory operand *Xmem* is shifted left 16 bits and added to accumulator A. The result is rounded by adding 2<sup>15</sup> to the high part of the accumulator (bits 31–16). The result is stored in accumulator A. In parallel, *Xmem* and *Ymem* are multiplied and the result is added to accumulator B. *Xmem* does not overwrite T; therefore, T always contains the error value used to update coefficients.

**Words**                     1 word

**Cycles**                    1 cycle

**Classes**                  Class 7 (see page 3-12)

- 2:  $(Xmem) \times (Ymem) + (src) \rightarrow dst$   
 $(Xmem) \rightarrow T$
- 3:  $(T) \times lk + (src) \rightarrow dst$
- 4:  $(Smem) \times lk + (src) \rightarrow dst$   
 $(Smem) \rightarrow T$

**Status Bits**

Affected by FRCT and OVM  
 Affects OVDst (or OVsrc, if dst is not specified)

**Description**

This instruction multiplies and adds with or without rounding. The result is stored in *dst* or *src*, as specified. For syntaxes 2 and 4, the data-memory value after the instruction is stored in T. T is updated in the read phase.

If you use the R suffix, this instruction rounds the result of the multiply and accumulate operation by adding  $2^{15}$  to the result and clearing the LSBs (15–0) to 0.

**Words**

Syntaxes 1 and 2: 1 word  
 Syntaxes 3 and 4: 2 words

Add 1 word when using long-offset indirect addressing or absolute addressing with an Smem.

**Cycles**

Syntaxes 1 and 2: 1 cycle  
 Syntaxes 3 and 4: 2 cycles

Add 1 cycle when using long-offset indirect addressing or absolute addressing with an Smem.

**Classes**

T	0444	0444
FRCT	1	1

**Syntax** **MACD** *Smem*, *pmad*, *src*

**Operands** *Smem*: Single data-memory operand  
*src*: A (accumulator A)  
           B (accumulator B)  
 $0 \leq pmad \leq 65535$

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	1	1	1	1	0	1	S	I	A	A	A	A	A	A	A
16-bit constant															

**Execution** *pmad* → PAR  
 If (RC) ≠ 0  
 Then  
     (*Smem*) × (Pmem addressed by PAR) + (*src*) → *src*  
     (*Smem*) → T  
     (*Smem*) → *Smem* + 1  
     (PAR) + 1 → PAR  
 Else  
     (*Smem*) × (Pmem addressed by PAR) + (*src*) → *src*  
     (*Smem*) → T  
     (*Smem*) → *Smem* + 1

**Status Bits** Affected by FRCT and OVM  
 Affects OVsrc

**Description** This instruction multiplies a single data-memory value *Smem* by a program-memory value *pmad*, adds the product to *src*, and stores the result in *src*. The data-memory value *Smem* is copied into T and into the next address following the *Smem* address. When this instruction is repeated, the program-memory address (in the program address register PAR) is incremented by 1. Once the repeat pipeline is started, the instruction becomes a single-cycle instruction. This function also contains the memory delay instruction (page 4-41).

**Words** 2 words

Add 1 word when using long-offset indirect addressing or absolute addressing with an *Smem*.

**Cycles** 3 cycles

Add 1 cycle when using long-offset indirect addressing or absolute addressing with an *Smem*.

**Classes** Class 23A (see page 3-53)  
 Class 23B (see page 3-55)

**Example**

MACD \*AR3-, COEFFS, A

Data Memory		
0100h	8765	8765
0200h	1234	1234

**Syntax**                    **MAR** *Smem*

**Operands**                *Smem*:    Single data-memory operand

**Opcod**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	1	1	0	1	1	0	1	I	A	A	A	A	A	A	A

**Execution**                In indirect addressing mode, the auxiliary register is modified as follows:  
 If compatibility is on (CMPT = 1), then:

If (AR<sub>x</sub> = AR<sub>0</sub>)  
                     AR(ARP) is modified  
                     ARP is unchanged

Else  
                     AR<sub>x</sub> is modified  
                     x → ARP

Else compatibility is off (CMPT = 0)  
                     AR<sub>x</sub> is modified  
                     ARP is unchanged

**Status Bits**                Affected by CMPT  
                                   Affects ARP (if CMPT = 1)

**Description**                This instruction modifies the content of the selected auxiliary register (AR<sub>x</sub>) as specified by *Smem*. In compatibility mode (CMPT = 1), this instruction modifies the AR<sub>x</sub> content as well as the auxiliary register pointer (ARP) value.

If CMPT = 0, the auxiliary register is modified but ARP is not.

**Words**                      1 word

Add 1 word when using long-offset indirect addressing or absolute addressing with an *Smem*.

**Cycles**                      1 cycle

Add 1 cycle when using long-offset indirect addressing or absolute addressing with an *Smem*.

**Classes**                    Class 1 (see page 3-3)  
                                   Class 2 (see page 3-4)

**Example 1**                    MAR \*AR3+

1	0	1	1	1	R	S	D	X	X	X	X	Y	Y	Y	Y

**Execution**

1:  $(src) - (Smem) \times (T) \rightarrow src$   
 2:  $(src) - (Xmem) \times (Ymem) \rightarrow dst$   
      $(Xmem) \rightarrow T$

**Status Bits**

Affected by FRCT and OVM  
 Affects OVdst (or OVsrc, if *dst* = *src*)

**Description**

This instruction multiplies an operand by the content of T or multiplies two operands, subtracts the result from *src* unless *dst* is specified, and stores the result in *src* or *dst*. *Xmem* is loaded into T in the read phase.

If you use the R suffix, this instruction rounds the result of the multiply and subtract operation by adding  $2^{15}$  to the result and clearing bits 15–0 of the result to 0.

The data addressed by *Xmem* is fed from DB and the data addressed by *Ymem* is fed from CB.

**Words**

1 word

Add 1 word when using long-offset indirect addressing or absolute addressing with an *Smem*.

**Cycles**

1 cycle

Add 1 cycle when using long-offset indirect addressing or absolute addressing with an *Smem*.

**Classes**

Syntax 1: Class 3A (see page 3-5)

                                       B (accumulator B)

**Opcode**                    15   14   13   12   11   10   9   8   7   6   5   4   3   2   1   0

1	1	1	1	0	1	0	D	1	0	0	0	0	1	1	1
---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---

**Execution**                If (A < B)  
                                       Then  
     (A) → *dst*  
     0 → C  
                                       Else  
     (B) → *dst*  
     1 → C

**Status Bits**              Affects C

**Description**              This instruction compares the content of the accumulators and stores the minimum value in *dst*. If the minimum value is in accumulator A, the carry bit, C, is cleared to 0; otherwise, it is set to 1.

**Words**                     1 word

**Cycles**                    1 cycle

**Classes**                    Class 1 (see page 3-3)

**Example 1**                 MIN A

	Before Instruction		After Instruction
A	FFCB	-53	FFCB
B	FFF6	-10	FFF6
C	1		0

**Example 2**                 MIN A

	Before Instruction		After Instruction
A	00 0000 1234		00 0000 1234
B	00 0000 1234		00 0000 1234
C	0		1

**Syntax**

- 1: **MPY[R]** *Smem, dst*
- 2: **MPY** *Xmem, Ymem, dst*
- 3: **MPY** *Smem, #lk, dst*
- 4: **MPY** *#lk, dst*

**Operands**

*Smem*: Single data-memory operand  
*Xmem, Ymem*: Dual data-memory operands  
*dst*: A (accumulator A)  
           B (accumulator B)

$-32\,768 \leq lk \leq 32\,767$

**Opcode**

1:

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	1	0	0	0	R	D	I	A	A	A	A	A	A	A

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	0	0	D	0	1	1	0	0	1	1	0
16-bit constant															

**Execution**

- 1:  $(T) \times (Smem) \rightarrow dst$
- 2:  $(Xmem) \times (Ymem) \rightarrow dst$   
 $(Xmem) \rightarrow T$
- 3:  $(Smem) \times lk \rightarrow dst$   
 $(Smem) \rightarrow T$
- 4:  $(T) \times lk \rightarrow dst$

**Status Bits**

Affected by FRCT and OVM  
 Affects OVdst

**Description**

This instruction multiplies the content of T or a data-memory value by a data-memory value or an immediate value, and stores the result in *dst*. T is loaded with the *Smem* or *Xmem* value in the read phase.

If you use the R suffix, this instruction optionally rounds the result of the multiply operation by adding  $2^{15}$  to the result and then clearing bits 15–0 to 0.

**Words**

Syntaxes 1 and 2: 1 word  
 Syntaxes 3 and 4: 2 words

Add 1 word when using long-offset indirect addressing or absolute addressing with an Smem.

**Cycles**

Syntaxes 1 and 2: 1 cycle  
 Syntaxes 3 and 4: 2 cycles

Add 1 cycle when using long-offset indirect addressing or absolute addressing with an Smem.

**Classes**

Syntax 1: Class 3A (see page 3-5)  
 Syntax 1: Class 3B (see page 3-6)  
 Syntax 2: Class 7 (see page 3-12)  
 Syntax 3: Class 6A (see page 3-10)  
 Syntax 3: Class 6B (see page 3-11)  
 Syntax 4: Class 2 (see page 3-4)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	1	0	D	1	0	0	0	1	1	0	0

**Execution**        1: (*Smem*) × (A(32–16)) → B  
     (*Smem*) → T  
                       2: (T) × (A(32–16)) → *dst*

**Status Bits**        Affected by FRCT and OVM  
     Affects OVdst (OVB in syntax 1)

**Description**        This instruction multiplies the high part of accumulator A (bits 32–16) by a single data-memory operand *Smem* or by the content of T, and stores the result in *dst* or accumulator B. T is updated in the read phase.

**Words**             1 word  
     Add 1 word when using long-offset indirect addressing or absolute addressing with an *Smem*.

**Cycles**            1 cycle  
     Add 1 cycle when using long-offset indirect addressing or absolute addressing with an *Smem*.

**Classes**            Syntax 1: Class 3A (see page 3-5)  
     Syntax 1: Class 3B (see page 3-6)  
     Syntax 2: Class 1 (see page 3-3)

**Example 1**        `MPYA *AR2`

	Before Instruction	After Instruction
A	FF 8765 1111	FF 8765 1111
B	00 0000 0320	FF D743 6558

T	4567	4567
FRCT	0	0

**Syntax**                    **MPYU** *Smem, dst*

**Operands**                *Smem*:    Single data-memory operand  
                               *dst*:        A (accumulator A)  
     B (accumulator B)

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	1	0	0	1	0	D	I	A	A	A	A	A	A	A

**Execution**                unsigned(T) × unsigned(*Smem*) → *dst*

**Status Bits**              Affected by FRCT and OVM  
                                   Affects OVdst

**Description**              This instruction multiplies the unsigned content of T by the unsigned content of the single data-memory operand *Smem*, and stores the result in *dst*. The multiplier acts as a signed 17 × 17-bit multiplier for this instruction with the MSB of both operands cleared to 0. This instruction is particularly useful for computing multiple-precision products, such as multiplying two 32-bit numbers to yield a 64-bit product.

**Words**                     1 word

Add 1 word when using long-offset indirect addressing or absolute addressing with an *Smem*.

**Cycles**                    1 cycle

Add 1 cycle when using long-offset indirect addressing or absolute addressing with an *Smem*.

**Classes**                    Class 3A (see page 3-5)  
                                   Class 3B (see page 3-6)

8000h	1234	1234

**Syntax** MVDK *Smem, dmad*

**Operands** Smem: Single data-memory operand  
 $0 \leq dmad \leq 65\,535$

**Execution** (dmad) → EAR  
 If (RC) ≠ 0  
 Then  
     (Smem) → Dmem addressed by EAR  
     (EAR) + 1 → EAR  
 Else  
     (Smem) → Dmem addressed by EAR

**Status Bits** None

**Description** This instruction copies the content of a single data-memory operand *Smem* to a data-memory location addressed by a 16-bit immediate value *dmad* (address is in the EAB address register EAR). You can use this instruction with the single-repeat instruction to move consecutive words in data memory (using indirect addressing). The number of words to be moved is one greater than the number contained in the repeat counter at the beginning of the instruction. Once the repeat pipeline is started, the instruction becomes a single-cycle instruction.

**Words** 2 words  
 Add 1 word when using long-offset indirect addressing or absolute addressing with an Smem.

**Cycles** 2 cycles  
 Add 1 cycle when using long-offset indirect addressing or absolute addressing with an Smem.

**Classes** Class 19A (see page 3-40)  
 Class 19B (see page 3-42)

**Example 1** MVDK 10, 8000h

**Example 2**

	Before Instruction	After Instruction
AR3	01FF	01FE
Data Memory		
1000h	ABCD	1234
01FFh	1234	1234

**Syntax** **MVDM** *dmad*, *MMR*

**Operands** MMR: Memory-mapped register  
 $0 \leq dmad \leq 65\,535$

**Execution**

$dmad \rightarrow DAR$   
 If  $(RC) \neq 0$   
 Then  
     (Dmem addressed by DAR)  $\rightarrow$  MMR  
      $(DAR) + 1 \rightarrow DAR$   
 Else  
     (Dmem addressed by DAR)  $\rightarrow$  MMR

**Status Bits** None

**Description** This instruction copies data from a data-memory location *dmad* (address is in the DAB address register DAR) to a memory-mapped register *MMR*. The data-memory value is addressed with a 16-bit immediate value. Once the repeat pipeline is started, the instruction becomes a single-cycle instruction.

**Words** 2 words

**Cycles** 2 cycles

**Classes** Class 19A (see page 3-40)

**Example** MVDM 300h, BK

**Syntax** **MVDP** *Smem*, *pmad*

**Operands** *Smem*: Single data-memory operand  
 $0 \leq pmad \leq 65\,535$

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	1	1	1	1	1	0	1		I	A	A	A	A	A	A
16-bit constant															

**Execution**

*pmad* → PAR  
 If (RC) ≠ 0  
 Then  
     (*Smem*) → Pmem addressed by PAR  
     (PAR) + 1 → PAR  
 Else  
     (*Smem*) → Pmem addressed by PAR

**Status Bits** None

**Description** This instruction copies a 16-bit single data-memory operand *Smem* to a program-memory location addressed by a 16-bit immediate value *pmad*. You can use this instruction with the repeat instruction to move consecutive words in data memory (using indirect addressing) to the contiguous program-memory space addressed by 16-bit immediate values. The source and destination blocks do not have to be entirely on-chip or off-chip. When used with repeat, this instruction becomes a single-cycle instruction after the repeat pipeline starts. In addition, when repeat is used with this instruction, interrupts are inhibited. Once the repeat pipeline is started, the instruction becomes a single-cycle instruction.

**Words** 2 words

Add 1 word when using long-offset indirect addressing or absolute addressing with an *Smem*.

**Cycles** 4 cycles

Add 1 cycle when using long-offset indirect addressing or absolute addressing with an *Smem*.

**Classes** Class 20A (see page 3-44)  
 Class 20B (see page 3-46)

**Example**

MVDP 0, 0FE00h

	<b>Before Instruction</b>	<b>After Instruction</b>

**Syntax** **MVKD** *dmad*, *Smem*

**Operands** *Smem*: Single data-memory operand  
 $0 \leq dmad \leq 65\,535$

**Execution**

*dmad* → DAR  
 If (RC) ≠ 0  
 Then  
     (Dmem addressed by DAR) → *Smem*  
     (DAR) + 1 → DAR  
 Else  
     (Dmem addressed by DAR) → *Smem*

**Status Bits** None

**Description** This instruction moves data from data memory to data memory. The source data-memory value is addressed with a 16-bit immediate operand *dmad* and is moved to *Smem*. You can use this instruction with the single repeat instruction to move consecutive words in data memory (using indirect addressing). The number of words to move is one greater than the number contained in the repeat counter at the beginning of the instruction. Once the repeat pipeline is started, the instruction becomes a single-cycle instruction.

**Words** 2 words

Add 1 word when using long-offset indirect addressing or absolute addressing with an *Smem*.

**Cycles** 2 cycles

Add 1 cycle when using long-offset indirect addressing or absolute addressing with an *Smem*.

**Classes** Class 19A (see page 3-40)  
 Class 19B (see page 3-42)

**Example 1** `MVKD 300h, 0`

<b>Execution</b>	None																																
<b>Status Bits</b>	None																																
<b>Description</b>	No operation is performed. Only the PC is incremented. This is useful to create pipeline and execution delays.																																
<b>Words</b>	1 word																																
<b>Cycles</b>	1 cycle																																
<b>Classes</b>	Class 1 (see page 3-3)																																
<b>Example</b>	NOP  No operation is performed.																																

**Syntax**                    **NORM** *src* [, *dst* ]

**Operands**                *src*, *dst* : A (accumulator A)  
  B (accumulator B)

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	1	S	D	1	0	0	0	1	1	1	1

**Execution**                (*src*) << TS → *dst*

**Status Bits**             Affected by SXM and OVM  
  Affects OVdst (or OVsrc, when *dst* = *src*)

**Description**             The signed number contained in *src* is normalized and the value is stored in *dst* or *src*, if *dst* is not specified. Normalizing a fixed-point number separates the number into a mantissa and an exponent by finding the magnitude of the sign-extended number.

This instruction allows single-cycle normalization of the accumulator once the EXP instruction, which computes the exponent of a number, has executed. The shift value is defined by T(5–0) and coded as a 2s-complement number. The valid shift values are –16 to 31. For the normalization, the shifter needs the shift value (in T) in the read phase; the normalization is executed in the execution phase.

**Words**                    1 word

**Cycles**                  1 cycle

**Classes**                 Class 1 (see page 3-3)

**Example 1**                **NORM** A

	Before Instruction		After Instruction
A	FF FFFF F001	A	FF 8008 0000
T	0013	T	0013

**Example 2**                **NORM** B, A

	Before Instruction		After Instruction
A	FF FFFF F001	A	00 4214 1414
B	21 0A0A 0A0A	B	21 0A0A 0A0A
T	0FF9	T	0FF9

**Syntax**

- 1: **OR** *Smem*, *src*
- 2: **OR** *#lk* [, *SHFT*], *src* [, *dst*]
- 3: **OR** *#lk*, **16**, *src* [, *dst*]
- 4: **OR** *src* [, *SHIFT*], [, *dst*]

**Operands**

*src*, *dst* :     A (accumulator A)  
                   B (accumulator B)

*Smem* :         Single data-memory operand

$0 \leq \text{SHFT} \leq 15$   
 $-16 \leq \text{SHIFT} \leq 15$   
 $0 \leq \text{lk} \leq 65\,535$

**Opcode**

1:

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	1	1	0	1	S	I	A	A	A	A	A	A	A

2:

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	0	S	D	0	1	0	0	S	H	F	T
16-bit constant															

3:

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	0	S	D	0	1	1	0	0	1	0	0
16-bit constant															

4:

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	0	S	D	1	0	1	S	H	I	F	T

**Execution**

- 1: (*Smem*) OR (*src*(15–0)) → *src*  
       *src*(39–16) unchanged
- 2: *lk* << *SHFT* OR (*src*) → *dst*
- 3: *lk* << 16 OR (*src*) → *dst*
- 4: (*src* or [*dst*]) OR (*src*) << *SHIFT* → *dst*

**Status Bits**           None

**Description**

This instruction ORs the *src* with a single data-memory operand *Smem*, a left-shifted 16-bit immediate value *lk*, *dst*, or with itself. The result is stored in *dst*, or *src* if *dst* is not specified. The values can be shifted as indicated by the instruction. For a positive (left) shift, low-order bits are cleared and high-order bits are not sign extended. For a negative (right) shift, high-order bits are not sign extended.

**Words**

Syntaxes 1 and 4: 1 word  
 Syntaxes 2 and 3: 2 words

Add 1 word when using long-offset indirect addressing or absolute addressing with an Smem.

**Cycles**

Syntaxes 1 and 4: 1 cycle  
 Syntaxes 2 and 3: 2 cycles

Add 1 cycle when using long-offset indirect addressing or absolute addressing with an Smem.

**Classes**

Syntax 1: Class 3A (see page 3-5)  
 Syntax 1: Class 3B (see page 3-6)  
 Syntaxes 2 and 3: Class 2 (see page 3-4)  
 Syntax 4: Class 1 (see page 3-3)

**Example 1**

OR \*AR3+, A

	<b>Before Instruction</b>	<b>After Instruction</b>
A	00 00FF 1200	A 00 00FF 1700
AR3	0100	AR3 0101
Data Memory		
0100h	1500	0100h 1500

**Example 2**

OR A, +3, B

	<b>Before Instruction</b>	<b>After Instruction</b>
A	00 0000 1200	A 00 0000 1200
B	00 0000 1800	B 00 0000 9800

**Syntax** `ORM #lk, Smem`

**Operands** Smem: Single data-memory operand  
 $0 \leq lk \leq 65\,535$

**Execution** `lk OR (Smem) → Smem`

**Status Bits** None

**Description** This instruction ORs the single data-memory operand *Smem* with a 16-bit constant *lk*, and stores the result in *Smem*. This instruction is a memory-to-memory operation.

**Note:**

This instruction is not repeatable.

**Words** 2 words

Add 1 word when using long-offset indirect addressing or absolute addressing with an Smem.

**Cycles** 2 cycles

Add 1 cycle when using long-offset indirect addressing or absolute addressing with an Smem.

**Classes** Class 18A (see page 3-39)  
 Class 18B (see page 3-39)

**Example** `ORM 0404h, *AR4+`

**Syntax** POLY *Smem*

**Operands** *Smem* : Single data-memory operand

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	1	1	0	1	1	0	I	A	A	A	A	A	A	A

**Execution** Round  $(A(32-16) \times (T) + (B)) \rightarrow A$   
 $(Smem) \ll 16 \rightarrow B$

**Status Bits** Affected by FRCT, OVM, and SXM  
 Affects OVA

**Description** This instruction shifts the content of the single data-memory operand *Smem* 16 bits to the left and stores the result in accumulator B. In parallel, this instruction multiplies the high part of accumulator A (bits 32–16) by the content of T, adds the product to accumulator B, rounds the result of this operation, and stores the final result in accumulator A. This instruction is useful for polynomial evaluation to implement computations that take one cycle per monomial to execute.

**Words** 1 word

Add 1 word when using long-offset indirect addressing or absolute addressing with an *Smem*.

**Cycles** 1 cycle

Add 1 cycle when using long-offset indirect addressing or absolute addressing with an *Smem*.

**Classes** Class 3A (see page 3-5)  
 Class 3B (see page 3-6)

**Example** POLY \*AR3+%

0055				
0092				

**Syntax**                    **POPM** *MMR*

**Operands**                *MMR*:     Memory-mapped register

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	0	0	0	1	0	1	0	I	A	A	A	A	A	A	A

**Execution**                (TOS) → *MMR*  
 (SP) + 1 → SP

**Status Bits**              None

**Description**             This instruction moves the content of the data-memory location addressed by SP to the specified memory-mapped register *MMR*. SP is incremented by 1.

**Words**                    1 word

**Cycles**                   1 cycle

**Classes**                  Class 17A (see page 3-36)

**Example**                  POPM AR5

	Before Instruction	After Instruction
AR5	0055	0060
SP	03F0	03F1
Data Memory		
03F0h	0060	0060

**Syntax** **PORTR** *PA*, *Smem*

**Operands** *Smem*: Single data-memory operand  
 $0 \leq PA \leq 65\,535$

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	1	1	1	0	1	0	0	I	A	A	A	A	A	A	A
Port address															

**Execution** (*PA*) → *Smem*

**Status Bits** None

**Description** This instruction reads a 16-bit value from an external I/O port *PA* (16-bit immediate address) into the specified data-memory location *Smem*. The  $\overline{IS}$  signal goes low to indicate an I/O access, and the  $\overline{IOSTRB}$  and READY timings are the same as for an external data memory read.

**Words** 2 words

Add 1 word when using long-offset indirect addressing or absolute addressing with an *Smem*.

**Cycles** 2 cycles (dependent on the external I/O operation)

Add 1 cycle when using long-offset indirect addressing or absolute addressing with an *Smem*.

**Classes** Class 27A (see page 3-63)  
Class 27B (see page 3-63)

**Example** `PORTR 05, INDAT ; INDAT .equ 60h`

	<b>Before Instruction</b>		<b>After Instruction</b>

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	1	1	Z	0	C	C	C	C	C	C	C	C

**Execution**

If (cond(s))

Then

(TOS)  $\rightarrow$  PC

(SP) + 1  $\rightarrow$  SP

Else

(PC) + 1  $\rightarrow$  PC

**Status Bits**

None

**Description**

If the conditions given by *cond* are met, this instruction replaces the PC with the data-memory value from the TOS and increments the SP by 1. If the conditions are not met, this instruction just increments the PC by 1.

If the return is delayed (specified by the D suffix), the two 1-word instructions or one 2-word instruction following this instruction is fetched and executed. The two instruction words following this instruction have no effect on the condition(s) being tested.

This instruction tests multiple conditions before passing control to another section of the program. It can test the conditions individually or in combination with other conditions. You can combine conditions from only one group as follows:

- Group 1 You can select up to two conditions. Each of these conditions must be from a different category (category A or B); you cannot have two conditions from the same category. For example, you can test EQ and OV at the same time but you cannot test GT and NEQ at the same time. The accumulator must be the same for both conditions; you cannot test conditions for both accumulators with the same instruction. For example, you can test AGT and AOV at the same time, but you cannot test AGT and BOV at the same time.
- Group 2 You can select up to three conditions. Each of these conditions must be from a different category (category A, B, or C); you cannot have two conditions from the same category. For example, you can test TC, C, and BIO at the same time but you cannot test NTC, C, and NC at the same time.

**Conditions for This Instruction**

Group 1		Group 2		
Category A	Category B	Category A	Category B	Category C
EQ	OV	TC	C	BIO
NEQ	NOV	NTC	NC	NBIO
LT				
LEQ				
GT				
GEQ				

**Note:**

This instruction is not repeatable.

- Words** 1 word
- Cycles** 5 cycles (true condition)  
3 cycles (false condition)  
3 cycles (delayed)
- Classes** Class 32 (see page 3-70)

**Example**

```
RC AGEQ, ANOV          ; return is executed if the accumulator A
                        ; contents are positive and the OVA bit
                        ; is a zero
```

	<b>Before Instruction</b>	<b>After Instruction</b>
PC	<input type="text" value="0807"/>	<input type="text" value="2002"/>
OVA	<input type="text" value="0"/>	<input type="text" value="0"/>
SP	<input type="text" value="0308"/>	<input type="text" value="0309"/>
Data Memory		
0308h	<input type="text" value="2002"/>	0308h <input type="text" value="2002"/>

**Syntax**                    **READA** *Smem*

**Operands**                *Smem*:     Single data-memory operand

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	1	1	1	1	1	1	0	I	A	A	A	A	A	A	A

**Execution**

A → PAR  
 If ((RC) ≠ 0)  
     (Pmem (addressed by PAR)) → *Smem*  
     (PAR) + 1 → PAR  
     (RC) – 1 → RC  
 Else  
     (Pmem (addressed by PAR)) → *Smem*

**Status Bits**             None

**Description**            This instruction transfers a word from a program-memory location specified by accumulator A to a data-memory location specified by *Smem*. Once the repeat pipeline is started, the instruction becomes a single-cycle instruction. The program-memory location is defined by Accumulator A, depending on the specific device, as follows:

	<b>Devices with Extended Program Memory</b>
<b>C541–C546</b>	
A(15–0)	A(22–0)

This instruction can be used with the repeat instruction to move consecutive words (starting with the address specified in accumulator A) to a contiguous data-memory space addressed using indirect addressing. Source and destination blocks do not need to be entirely on-chip or off-chip.

**Words**                    1 word

Add 1 word when using long-offset indirect addressing or absolute addressing with an *Smem*.

**Cycles**                    5 cycles

Add 1 cycle when using long-offset indirect addressing or absolute addressing with an *Smem*.

**Classes**                 Class 25A (see page 3-57)  
                               Class 25B (see page 3-59)

**Example**

READA 6

	Before Instruction	After Instruction
A	00 0000 0023	00 0000 0023
DP	004	004
Program Memory		
0023h	0306	0306
Data Memory		
0206h	0075	0306

**Syntax**                    **RESET**

**Operands**                 None

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	1	1	1	1	1	1	0	0	0	0	0

**Execution**                 These fields of PMST, ST0, and ST1 are loaded with the values shown:

(IPTR) << 7 → PC	0 → OVA	0 → OVB
1 → C	1 → TC	0 → ARP
0 → DP	1 → SXM	0 → ASM
0 → BRAF	0 → HM	1 → XF
0 → C16	0 → FRCT	0 → CMPT
0 → CPL	1 → INTM	0 → IFR
0 → OVM		

**Status Bits**                 The status bits affected are listed in the execution section.

**Description**                 This instruction performs a nonmaskable software reset that can be used at any time to put the '54x into a known state. When the reset instruction is executed, the operations listed in the execution section occur. The MP/MC pin is not sampled during this software reset. The initialization of IPTR and the peripheral registers is different from the initialization using RS. This instruction is not affected by INTM; however, it sets INTM to 1 to disable interrupts.

**Note:**

This instruction is not repeatable.

**Words**                        1 word

**Cycles**                      3 cycles

**Classes**                     Class 35 (see page 3-72)

**Example**                     RESET

	Before Instruction	After Instruction
PC	0025	0080
INTM	0	1
IPTR	1	1

**Syntax** RET[D]**Operands** None

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	1	1	Z	0	0	0	0	0	0	0	0	0

**Execution** (TOS) → PC  
(SP) + 1 → SP

**Status Bits** None

**Description** This instruction replaces the value in the PC with the 16-bit value from the TOS. The SP is incremented by 1. If the return is delayed (specified by the D suffix), the two 1-word instructions or one 2-word instruction following this instruction is fetched and executed.

**Note:**

This instruction is not repeatable.

**Words** 1 word

**Cycles** 5 cycles  
3 cycles (delayed)

**Classes** Class 32 (see page 3-70)**Example** RET

	Before Instruction	After Instruction
PC	<input type="text" value="2112"/>	<input type="text" value="1000"/>
SP	<input type="text" value="0300"/>	<input type="text" value="0301"/>
Data Memory		
0300h	<input type="text" value="1000"/>	0300h <input type="text" value="1000"/>

**Syntax**                    **RETE[D]**

**Operands**                 None

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	1	Z	0	1	1	1	0	1	0	1	1

**Execution**                (TOS) → PC  
 (SP) + 1 → SP  
 0 → INTM

**Status Bits**             Affects INTM

**Description**            This instruction replaces the value in the PC with the 16-bit value from the TOS. Execution continues from this address. The SP is incremented by 1. This instruction automatically clears the interrupt mask bit (INTM) in ST1. (Clearing this bit enables interrupts.) If the return is delayed (specified by the D suffix), the two 1-word instructions or one 2-word instruction following this instruction is fetched and executed.

**Note:**  
 This instruction is not repeatable.

**Words**                     1 word

**Cycles**                   5 cycles  
 3 cycles (delayed)

**Classes**                 Class 32 (see page 3-70)

**Example**                 RETE

	Before Instruction	After Instruction
PC	01C3	0110
SP	2001	2002
ST1	xCxx	x4xx
Data Memory		
2001h	0110	0110

**Syntax**                    **RETF[D]**

**Operands**                None

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	1	Z	0	1	0	0	1	1	0	1	1

**Execution**                (RTN) → PC  
 (SP) + 1 → SP  
 0 → INTM

**Status Bits**             Affects INTM

**Description**             This instruction replaces the value in the PC with the 16-bit value in RTN. RTN holds the address to which the interrupt service routine should return. RTN is loaded into the PC during the return instead of reading the PC from the stack. The SP is incremented by 1. This instruction automatically clears the interrupt mask bit (INTM) in ST1. (Clearing this bit enables interrupts.) If the return is delayed (specified by the D suffix), the two 1-word instructions or one 2-word instruction following this instruction is fetched and executed.

**Note:**

You can use this instruction only if no call is performed during the interrupt service routine and no other interrupt routine is taken.

This instruction is not repeatable.

**Words**                    1 word

**Cycles**                   3 cycles  
 1 cycle (delayed)

**Classes**                 Class 33 (see page 3-71)

**Example**                 RETF

	Before Instruction	After Instruction
PC	01C3	0110
SP	2001	2002
ST1	xCxx	x4xx
Data Memory		
2001h	0110	0110
2001h		0110

**Syntax** RND *src* [, *dst* ]

**Operands** *src* , *dst*: A (accumulator A)  
B (accumulator B)

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	1	S	D	1	0	0	1	1	1	1	1

**Execution** (*src*) + 8000h → *dst*

**Status Bits** Affected by OVM

**Description** This instruction rounds the content of *src* (either A or B) by adding  $2^{15}$ . The rounded value is stored in *dst* or *src*, if *dst* is not specified.

**Note:**

This instruction is not repeatable.

**Words** 1 word

**Cycles** 1 cycle

**Classes** Class 1 (see page 3-3)

**Example 1** RND A, B

	Before Instruction		After Instruction
A	FF FFFF FFFF	A	FF FFFF FFFF
B	00 0000 0001	B	00 0000 7FFF
OVM	0	OVM	0

**Example 2** RND A

	Before Instruction		After Instruction
A	00 7FFF FFFF	A	00 7FFF FFFF
OVM	1	OVM	1

**Syntax** **ROL** *src*

**Operands** *src* : A (accumulator A)  
                   B (accumulator B)

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	1	0	S	1	0	0	1	0	0	0	1

**Execution** (C) → *src*(0)  
                   (*src*(30–0)) → *src*(31–1)  
                   (*src*(31)) → C  
                   0 → *src*(39–32)

**Status Bits** Affected by C  
                   Affects C

**Description** This instruction rotates each bit of *src* left 1 bit. The value of the carry bit, C, before the execution of the instruction is shifted into the LSB of *src*. Then, the MSB of *src* is shifted into C. The guard bits of *src* are cleared.

**Words** 1 word

**Cycles** 1 cycle

**Classes** Class 1 (see page 3-3)

**Example** ROL A

	Before Instruction		After Instruction
A	5F B000 1234	A	00 6000 2468
C	0	C	1

**Syntax** **ROLTC** *src*

**Operands** src: A (accumulator A)  
B (accumulator B)

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	1	0	S	1	0	0	1	0	0	1	0

**Execution**

(TC) → src(0)  
 (src(30–0)) → src(31–1)  
 (src(31)) → C  
 0 → src(39–32)

**Status Bits**

Affects C  
 Affected by TC

**Description**

This instruction rotates each bit of *src* left 1 bit. The value of the TC bit before the execution of the instruction is shifted into the LSB of *src*. Then, the MSB of *src* is shifted into C. The guard bits of *src* are cleared.

**Words** 1 word

**Cycles** 1 cycle

**Classes** Class 1 (see page 3-3)

**Example** ROLTC A

	Before Instruction		After Instruction
A	81 C000 5555	A	00 8000 AAAB
C	x	C	1
TC	1	TC	1

**Syntax**                    **ROR** *src*

**Operands**                *src*:    A (accumulator A)  
                                       B (accumulator B)

**Opcode**                    15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

1	1	1	1	0	1	0	S	1	0	0	1	0	0	0	0
---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---

**Execution**                (C) → *src*(31)  
                                       (*src*(31–1)) → *src*(30–0)  
                                       (*src*(0)) → C  
                                       0 → *src*(39–32)

**Status Bits**              Affects C  
                                       Affected by C

**Description**              This instruction rotates each bit of *src* right 1 bit. The value of the carry bit, C, before the execution of the instruction is shifted into the MSB of *src*. Then, the LSB of *src* is shifted into C. The guard bits of *src* are cleared.

**Words**                     1 word

**Cycles**                    1 cycle

**Classes**                    Class 1 (see page 3-3)

**Example**                    ROR A

	Before Instruction		After Instruction
A	7F B000 1235		00 5800 091A
C	0		1

**Syntax**

1: **RPT** *Smem*  
 2: **RPT** *#K*  
 3: **RPT** *#lk*

**Operands**

*Smem*: Single data-memory operand  
 $0 \leq K \leq 255$   
 $0 \leq lk \leq 65\,535$

**Opcode**

1:

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	1	0	0	0	1	1	1	I	A	A	A	A	A	A	A

2:

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	0	1	1	0	0	K	K	K	K	K	K	K	K

3:

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	0	0	0	0	1	1	1	0	0	0	0
16-bit constant															

**Execution**

1: (*Smem*) → RC  
 2: K → RC  
 3: lk → RC

**Status Bits** None

**Description**

The repeat counter (RC) is loaded with the number of iterations when this instruction is executed. The number of iterations (*n*) is given in a 16-bit single data-memory operand *Smem* or an 8- or 16-bit constant, *K* or *lk*, respectively. The instruction following the repeat instruction is repeated *n* + 1 times. You cannot access RC while it decrements.

**Note:**

This instruction is not repeatable.

**Words**

Syntaxes 1 and 2: 1 word  
 Syntax 3: 2 words

Add 1 word when using long-offset indirect addressing or absolute addressing with an *Smem*.

**Cycles**

Syntax 1: 3 cycles  
 Syntax 2: 1 cycle  
 Syntax 3: 2 cycles

Add 1 cycle when using long-offset indirect addressing or absolute addressing with an *Smem*.

**Classes**

Syntax 1: Class 5A (see page 3-9)

Syntax 1: Class 5B (see page 3-9)

Syntax 2: Class 1 (see page 3-3)

Syntax 3: Class 2 (see page 3-4)

**Example 1**

RPT DAT127 ; DAT127 .EQU 0FFF

	<b>Before Instruction</b>		<b>After Instruction</b>
RC	<input type="text" value="0"/>	RC	<input type="text" value="000C"/>
DP	<input type="text" value="031"/>	DP	<input type="text" value="031"/>
Data Memory			
0FFFh	<input type="text" value="000C"/>	0FFFh	<input type="text" value="000C"/>

**Example 2**

RPT #2 ; Repeat next instruction 3 times

	<b>Before Instruction</b>		<b>After Instruction</b>
RC	<input type="text" value="0"/>	RC	<input type="text" value="0002"/>

**Example 3**

RPT #1111h ; Repeat next instruction 4370 times

	<b>Before Instruction</b>		<b>After Instruction</b>
RC	<input type="text" value="0"/>	RC	<input type="text" value="1111"/>

**Syntax**                    **RPTB[D]** *pmad*

**Operands**                 $0 \leq pmad \leq 65\,535$

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	0	Z	0	0	1	1	1	0	0	1	0
16-bit constant															

**Execution**

1 → BRAF  
 If (delayed) then  
     (PC) + 4 → RSA  
 Else  
     (PC) + 2 → RSA  
 pmad → REA

**Status Bits**            Affects BRAF

**Description**

This instruction repeats a block of instructions the number of times specified by the memory-mapped block-repeat counter (BRC). BRC must be loaded before the execution of this instruction. When this instruction is executed, the block-repeat start address register (RSA) is loaded with PC + 2 (or PC + 4 if you use the delayed instruction) and the block-repeat end address register (REA) is loaded with the program-memory address (*pmad*).

This instruction is interruptible. Single-instruction repeat loops can be included as part of block repeat blocks. To nest block repeat instructions you must ensure that:

- BRC, RSA, and REA are appropriately saved and restored.
- The block-repeat active flag (BRAFF) is properly set.

In a delayed block repeat (specified by the D suffix), the two 1-word instructions or the one 2-word instruction following this instruction is fetched and executed.

---

**Note:**

Block repeat can be deactivated by clearing the BRAFF bit.

Far branch and far call instructions cannot be included in a repeat block of instructions.

This instruction is not repeatable.

---

**Words**                    2 words

**Cycles**                    4 cycles  
                                   2 cycles (delayed)

**Classes**

Class 29A (see page 3-66)

**Example 1**

```

ST #99, BRC
RPTB end_block - 1
    ; end_block = Bottom of Block

```

	Before Instruction		After Instruction
PC	<input type="text" value="1000"/>	PC	<input type="text" value="1002"/>
BRC	<input type="text" value="1234"/>	BRC	<input type="text" value="0063"/>
RSA	<input type="text" value="5678"/>	RSA	<input type="text" value="1002"/>
REA	<input type="text" value="9ABC"/>	REA	<input type="text" value="end_block - 1"/>

**Example 2**

```

ST #99, BRC ;execute the block 100 times
RPTBD end_block - 1
MVDM POINTER, AR1
    ; initialize pointer
    ; end_block ; Bottom of Block

```

	Before Instruction		After Instruction
PC	<input type="text" value="1000"/>	PC	<input type="text" value="1004"/>
BRC	<input type="text" value="1234"/>	BRC	<input type="text" value="0063"/>
RSA	<input type="text" value="5678"/>	RSA	<input type="text" value="1004"/>
REA	<input type="text" value="9ABC"/>	REA	<input type="text" value="end_block - 1"/>

**Syntax**                    **RPTZ** *dst, #lk*

**Operands**                *dst*:     A (accumulator A)  
     B (accumulator B)  
      $0 \leq lk \leq 65\,535$

**Opcode**

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	1	1	1	1	0	0	0	D	0	1	1	1	0	0	0	1
16-bit constant																

**Execution**                 $0 \rightarrow dst$   
      $lk \rightarrow RC$

**Status Bits**             None

**Description**            This instruction clears *dst* and repeats the next instruction  $n + 1$  times, where  $n$  is the value in the repeat counter (RC). The RC value is obtained from the 16-bit constant *lk*.

**Words**                    2 words

**Cycles**                   2 cycles

**Classes**                 Class 2 (see page 3-4)

**Example**                 `RPTZ A, 1023 ; Repeat the next instruction 1024 times`  
     `STL A, *AR2+`

	Before Instruction	After Instruction
A	0F FE00 8000	A    00 0000 0000

0				

**Syntax** **SFTL** *src*, *SHIFT* [, *dst* ]

**Operands** *src*, *dst*: A (accumulator A)  
                   B (accumulator B)  
 $-16 \leq \text{SHIFT} \leq 15$

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	0	S	D	1	1	1	S	H	I	F	T

**Execution**

If  $\text{SHIFT} < 0$   
 Then  
      $\text{src}((-\text{SHIFT}) - 1) \rightarrow \text{C}$   
      $\text{src}(31-0) \ll \text{SHIFT} \rightarrow \text{dst}$   
      $0 \rightarrow \text{dst}(39-(31 + (\text{SHIFT} + 1)))$

If  $\text{SHIFT} = 0$   
 Then  
      $0 \rightarrow \text{C}$

Else  
      $\text{src}(31 - (\text{SHIFT} - 1)) \rightarrow \text{C}$   
      $\text{src}((31 - \text{SHIFT})-0) \ll \text{SHIFT} \rightarrow \text{dst}$   
      $0 \rightarrow \text{dst}((\text{SHIFT} - 1)-0)$  [or  $\text{src}((\text{SHIFT} - 1)-0)$ , if *dst* is not specified]  
      $0 \rightarrow \text{dst}(39-32)$  [or  $\text{src}(39-32)$ , if *dst* is not specified]

**Status Bits** Affects C

**Description** This instruction logically shifts *src* and stores the result in *dst* or *src*, if *dst* is not specified. The guard bits of *dst* or *src*, if *dst* is not specified, are also cleared. The execution of the instruction depends on the SHIFT value:

- If the SHIFT value is less than 0, the following occurs:
  - 1)  $\text{src}((-\text{SHIFT}) - 1)$  is copied into the carry bit, C.
  - 2) A logical right shift is produced by the instruction.
  - 3) 0 is written into  $\text{dst}(39-(31 + (\text{SHIFT} + 1)))$ .
- If the SHIFT value is greater than 0, the following occurs:
  - 1)  $\text{src}(31 - (\text{SHIFT} - 1))$  is copied into the carry bit, C.
  - 2) A logical left shift is produced by the instruction.
  - 3) 0 is written into  $\text{dst}((\text{SHIFT} - 1)-0)$ .

SFTL B, +5

	<b>Before Instruction</b>	<b>After Instruction</b>
B	80 AA00 1234	00 4002 4680
C	0	1

**Syntax** **SQDST** *Xmem, Ymem*

**Operands** Xmem, Ymem: Dual data-memory operands

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	0	0	0	1	0	X	X	X	X	Y	Y	Y	Y

**Execution**  $(A(32-16)) \times (A(32-16)) + (B) \rightarrow B$   
 $((Xmem) - (Ymem)) \ll 16 \rightarrow A$

**Status Bits** Affected by OVM, FRCT, and SXM  
 Affects C, OVA, and OVB

**Description** Used in repeat single mode, this instruction computes the square of the distance between two vectors. The high part of accumulator A (bits 32–16) is squared, the product is added to accumulator B, and the result is stored in accumulator B. *Ymem* is subtracted from *Xmem*, the difference is shifted 16 bits left, and the result is stored in accumulator A. The value to be squared ( $A(32-16)$ ) is the value of the accumulator before the subtraction is executed by this instruction.

ALT	(A) < 0	0011	BLT	(B) < 0	1011
ALEQ	(A) ≤ 0	0111	BLEQ	(B) ≤ 0	1111

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	0	0	1	1	1	0	1	X	X	X	X	C	O	N	D

**Execution**

If (*cond*)  
Then  
(BRC) → *Xmem*  
Else  
(*Xmem*) → *Xmem*

**Status Bits** None

**Description**

If the condition is true, this instruction stores the content of the block-repeat counter (BRC) in *Xmem*. If the condition is false, the instruction reads *Xmem* and writes the value in *Xmem* back to the same address; thus, *Xmem* remains the same. Regardless of the condition, *Xmem* is always read and updated.

**Words** 1 word**Cycles** 1 cycle**Classes** Class 15 (see page 3-32)**Example** SRCCD \*AR5-, AGT

- 4:  $(\text{src}) \ll (\text{SHIFT} - 16) \rightarrow \text{Smem}$

**Status Bits**           Affected by SXM

**Description**

This instruction stores the high part of *src* (bits 31–16) in data-memory location *Smem*. The *src* is shifted left (as specified by ASM, SHFT, or SHIFT) and bits 31–16 of the shifted value are stored in data memory (*Smem* or *Xmem*). If SXM = 0, bit 39 of *src* is copied in the MSBs of the data-memory location. If SXM = 1, the sign-extended value with bit 39 of *src* is stored in the MSBs of the data-memory location after being right-shifted by the exceeding guard bit margin. The *src* remains unaffected.

**Notes:**

The following syntaxes are assembled as a different syntax in certain cases.

- Syntax 3: If *SHFT* = 0, the instruction opcode is assembled as syntax 1.
- Syntax 4: If *SHIFT* = 0, the instruction opcode is assembled as syntax 1.
- Syntax 4: If  $0 < SHIFT \leq 15$  and an indirect modifier is equal to one of the Xmem modes, the instruction opcode is assembled as syntax 3.

**Words**

Syntaxes 1, 2, and 3: 1 word  
 Syntax 4: 2 words

Add 1 word when using long-offset indirect addressing or absolute addressing with an Smem.

**Cycles**

Syntaxes 1, 2, and 3: 1 cycle  
 Syntax 4: 2 cycles

Add 1 cycle when using long-offset indirect addressing or absolute addressing with an Smem.

**Classes**

Syntaxes 1, 2, and 3: Class 10A (see page 3-22)  
 Syntaxes 1 and 2: Class 10B (see page 3-23)  
 Syntax 4: Class 11A (see page 3-24)  
 Syntax 4: Class 11B (see page 3-25)

**Example 1**

STH A, 10

	<b>Before Instruction</b>		<b>After Instruction</b>

0	1	1	0	1	1	1	1	I	A	A	A	A	A	A	A
0	0	0	0	1	1	0	S	1	0	0	S	H	I	F	T

**Execution**

- 1: (*src*) → *Smem*
- 2: (*src*) << *ASM* → *Smem*
- 3: (*src*) << *SHFT* → *Xmem*
- 4: (*src*) << *SHIFT* → *Smem*

**Status Bits**           Affected by *SXM*

**Description**

This instruction stores the low part of *src* (bits 15–0) in data-memory location *Smem*. The *src* is shifted left (as specified by *ASM*, *SHFT*, or *SHIFT*) and bits 15–0 of the shifted value are stored in data memory (*Smem* or *Xmem*). When the shifted value is positive, zeros are shifted into the LSBs.

**Notes:**

The following syntaxes are assembled as a different syntax in certain cases.

- Syntax 3: If  $SHFT = 0$ , the instruction opcode is assembled as syntax 1.
- Syntax 4: If  $SHIFT = 0$ , the instruction opcode is assembled as syntax 1.
- Syntax 4: If  $0 < SHIFT \leq 15$  and an indirect modifier is equal to one of the Xmem modes, the instruction opcode is assembled as syntax 3.

**Words**

Syntaxes 1, 2, and 3: 1 word

Syntax 4: 2 words

Add 1 word when using long-offset indirect addressing or absolute addressing with an Smem.

**Cycles**

Syntaxes 1, 2, and 3: 1 cycle

Syntax 4: 2 cycles

Add 1 cycle when using long-offset indirect addressing or absolute addressing with an Smem.

**Classes**

Syntaxes 1, 2, and 3: Class 10A (see page 3-22)

Syntaxes 1, 2, and 3: Class 10B (see page 3-23)

Syntax 4: Class 11A (see page 3-24)

Syntax 4: Class 11B (see page 3-25)

**Syntax**

```

1:  ST src, Ymem
    || LD Xmem, dst
2:  ST src, Ymem
    || LD Xmem, T

```

**Operands**

src, dst:           A (accumulator A)  
                      B (accumulator B)

Xmem, Ymem:       Dual data-memory operands

**Opcode**

1:

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	0	0	1	0	S	D	X	X	X	X	Y	Y	Y	Y

2:

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	0	0	1	S	0	X	X	X	X	Y	Y	Y	Y

**Execution**

1. (src) << (ASM – 16) → Ymem  
      (Xmem) << 16 → dst
2. (src) << (ASM – 16) → Ymem  
      (Xmem) → T

**Status Bits**

Affected by OVM and ASM  
Affects C

**Description**

This instruction stores *src* shifted by (ASM – 16) in data-memory location *Ymem*. In parallel, this instruction loads the 16-bit dual data-memory operand *Xmem* to *dst* or T. If *src* is equal to *dst*, the value stored in *Ymem* is the value of *src* before the execution.

**Words**           1 word

**Cycles**          1 cycle

**Classes**         Class 14 (see page 3-30)

**Example 1**

```
ST B, *AR2-
||LD *AR4+, A
```

	Before Instruction	After Instruction
A	00 0000 001C	FF 8001 0000
B	FF 8421 1234	FF 8421 1234
SXM	1	1
ASM	1C	1C
AR2	01FF	01FE
AR4	0200	0201
Data Memory		
01FFh	xxxx	F842
0200h	8001	8001

**Example 2**

```
ST A, *AR3
||LD *AR4, T
```

	Before Instruction	After Instruction
A	FF 8421 1234	FF 8421 1234
T	3456	80FF
ASM	1	1
AR3	0200	0200
AR4	0100	0100
Data Memory		
0200h	0001	0842
0100h	80FF	80FF

**Example 3**

```
ST A, *AR2+
||LD *AR2-, A
```

In Example 3, the LD reads the source operand at the memory location pointed to by AR2 before the ST writes to the same location. The ST reads the source operand of accumulator A before LD loads accumulator A.

**Syntax**            **ST** *src*, *Ymem*  
                       **|| MAC[R]** *Xmem*, *dst*

**Operands**        *src*, *dst*:            A (accumulator A)  
   B (accumulator B)  
*Xmem*, *Ymem*:      Dual data-memory operands

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	0	1	0	R	S	D	X	X	X	X	Y	Y	Y	Y

**Execution**        (*src* << (ASM – 16)) → *Ymem*  
 If (Rounding)  
                       Then  
                           Round ((*Xmem*) × (T) + (*dst*)) → *dst*  
 Else  
                           (*Xmem*) × (T) + (*dst*) → *dst*

**Status Bits**        Affected by OVM, SXM, ASM, and FRCT  
 Affects C and OVdst

**Description**        This instruction stores *src* shifted by (ASM – 16) in data-memory location *Ymem*. In parallel, this instruction multiplies the content of T by the data-memory operand *Xmem*, adds the value in *dst* (with or without rounding), and stores the result in *dst*. If *src* is equal to *dst*, the value stored in *Ymem* is the value of *src* before the execution of this instruction.

If you use the R suffix, this instruction rounds the result of the multiply accumulate operation by adding 2<sup>15</sup> to the result and clearing the LSBs (bits 15–0) to 0.

**Words**            1 word

**Cycles**            1 cycle

**Classes**            Class 14 (see page 3-30)

**Example 1**

```

AR5	0200	0201
Data Memory		
100h	1234	0001
200h	4321	4321

**Syntax** **ST** *src*, *Ymem*  
**|| MAS[R]** *Xmem*, *dst*

**Operands** *src*, *dst*: A (accumulator A)  
B (accumulator B)  
*Xmem*, *Ymem*: Dual data-memory operands

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	0	1	1	R	S	D	X	X	X	X	Y	Y	Y	Y

**Execution** (*src* << (ASM – 16)) → *Ymem*  
If (Rounding)  
    Then  
        Round ((*dst*) – (*Xmem*) × (T)) → *dst*  
Else  
    (*dst*) – (*Xmem*) × (T) → *dst*

**Status Bits** Affected by OVM, SXM, ASM, and FRCT  
Affects C and OVdst

**Description** This instruction stores *src* shifted by (ASM – 16) in data-memory location *Ymem*. In parallel, this instruction multiplies the content of T by the data-memory operand *Xmem*, subtracts the value from *dst* (with or without rounding), and stores the result in *dst*. If *src* is equal to *dst*, the value stored in *Ymem* is the value of *src* before the execution of this instruction.

If you use the R suffix, this instruction optionally rounds the result of the multiply subtract operation by adding  $2^{15}$  to the result and clearing the LSBs (bits 15–0) to 0.

<b>Execution</b>	(src << (ASM – 16)) → Ymem (Xmem) << 16 – (dst_) → dst																																
<b>Status Bits</b>	Affected by OVM, SXM, and ASM Affects C and OVdst																																
<b>Description</b>	This instruction stores <i>src</i> shifted by (ASM – 16) in data-memory location <i>Ymem</i> . In parallel, this instruction subtracts the content of <i>dst_</i> from the 16-bit dual data-memory operand <i>Xmem</i> shifted left 16 bits, and stores the result in <i>dst</i> . If <i>src</i> is equal to <i>dst</i> , then the value stored in <i>Ymem</i> is the value of <i>src</i> before the execution.																																
<b>Words</b>	1 word																																
<b>Cycles</b>	1 cycle																																
<b>Classes</b>	Class 14 (see page 3-30)																																
<b>Example</b>	ST A, *AR3–   SUB *AR5+0%, B																																

	Before Instruction	After Instruction

AR5	0300	0302
Data Memory		
01FFh	1111	0842
0300h	8001	8001

**Syntax**                    **STRCD** *Xmem, cond*

**Operands**                *Xmem*:            Dual data-memory operand

The following table lists the conditions (*cond* operand) for this instruction.

Cond	Description	Condition Code	Cond	Description	Condition Code
AEQ	(A) = 0	0101	BEQ	(B) = 0	1101
ANEQ	(A) ≠ 0	0100	BNEQ	(B) ≠ 0	1100
AGT	(A) > 0	0110	BGT	(B) > 0	1110
AGEQ	(A) ≥ 0	0010	BGEQ	(B) ≥ 0	1010
ALT	(A) < 0	0011	BLT	(B) < 0	1011
ALEQ	(A) ≤ 0	0111	BLEQ	(B) ≤ 0	1111

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	0	0	1	1	1	0	0	X	X	X	X	C	O	N	D

**Execution**                If (*cond*)  
                                   (T) → *Xmem*  
                                   Else  
                                   (*Xmem*) → *Xmem*

**Status Bits**                None

**Description**                If the condition is true, this instruction stores the content of T into the data-memory location *Xmem*. If the condition is false, the instruction reads *Xmem* and writes the value in *Xmem* back to the same address; thus, *Xmem* remains the same. Regardless of the condition, *Xmem* is always read and updated.

### Execution

- 1:  $(src) - (Smem) \rightarrow src$
- 2:  $(src) - (Smem) \ll TS \rightarrow src$
- 3:  $(src) - (Smem) \ll 16 \rightarrow dst$
- 4:  $(src) - (Smem) \ll SHIFT \rightarrow dst$
- 5:  $(src) - (Xmem) \ll SHFT \rightarrow src$
- 6:  $(Xmem) \ll 16 - (Ymem) \ll 16 \rightarrow dst$
- 7:  $(src) - lk \ll SHFT \rightarrow dst$
- 8:  $(src) - lk \ll 16 \rightarrow dst$
- 9:  $(dst) - (src) \ll SHIFT \rightarrow dst$
- 10:  $(dst) - (src) \ll ASM \rightarrow dst$

### Status Bits

Affected by SXM and OVM  
 Affects C and OVdst (or OVsrc, if dst = src)

For instruction syntax 3, if the result of the subtraction generates a borrow, the carry bit, C, is cleared to 0; otherwise, C is not affected.

### Description

This instruction subtracts a 16-bit value from the content of the selected accumulator or from the 16-bit operand *Xmem* in dual data-memory addressing mode. The 16-bit value to be subtracted is one of the following:

- The content of a single data-memory operand (*Smem*)
- The content of a dual data-memory operand (*Ymem*)
- A 16-bit immediate operand (*#lk*)
- The shifted value in *src*

If a *dst* is specified, this instruction stores the result in *dst*. If no *dst* is specified, this instruction stores the result in *src*. Most of the second operands can be shifted. For a left shift:

- Low-order bits are cleared
- High-order bits are:
  - Sign extended if SXM = 1
  - Cleared if SXM = 0

For a right shift, the high-order bits are:

- Sign extended if  $SXM = 1$
- Cleared if  $SXM = 0$

### Notes:

The following syntaxes are assembled as a different syntax in certain cases.

- Syntax 4: If  $dst = src$  and  $SHIFT = 0$ , then the instruction opcode is assembled as syntax 1.
- Syntax 4: If  $dst = src$ ,  $SHIFT \leq 15$ , and  $Smem$  indirect addressing mode is included in  $Xmem$ , then the instruction opcode is assembled as syntax 1.

### Words

Syntaxes 1, 2, 3, 5, 6, 9, and 10: 1 word  
Syntaxes 4, 7, and 8: 2 words

Add 1 word when using long-offset indirect addressing or absolute addressing with an  $Smem$ .

### Cycles

Syntaxes 1, 2, 3, 5, 6, 9, and 10: 1 cycle  
Syntaxes 4, 7, and 8: 2 cycles

Add 1 cycle when using long-offset indirect addressing or absolute addressing with an  $Smem$ .

### Classes

Syntaxes 1, 2, 3, and 5: Class 3A (see page 3-5)  
Syntaxes 1, 2, and 3: Class 3B (see page 3-6)  
Syntax 4: Class 4A (see page 3-7)  
Syntax 4: Class 4B (see page 3-8)  
Syntax 6: Class 7 (see page 3-12)  
Syntaxes 7 and 8: Class 2 (see page 3-4)  
Syntaxes 9 and 10: Class 1 (see page 3-3)

### Example 1

0405h	0006	0006

**Syntax**                    **SUBC** *Smem, src*

**Operands**                *Smem*:        Single data-memory operand  
                               *src*:            A (accumulator A)  
     B (accumulator B)

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	1	1	1	1	S	I	A	A	A	A	A	A	A

**Execution**                 $(src) - ((Smem) \ll 15) \rightarrow$  ALU output  
                               If ALU output  $\geq 0$   
     Then  
      $((ALU\ output) \ll 1) + 1 \rightarrow src$   
                               Else  $(src) \ll 1 \rightarrow src$

**Status Bits**              Affected by SXM  
                                   Affects C and OVsrc

**Description**             This instruction subtracts the 16-bit single data-memory operand *Smem*, left-shifted 15 bits, from the content of *src*. If the result is greater than 0, it is shifted 1 bit left, 1 is added to the result, and the result is stored in *src*. Otherwise, this instruction shifts the content of *src* 1 bit left and stores the result in *src*.

The divisor and the dividend are both assumed to be positive in this instruction. The SXM bit affects this operation in these ways:

- If SXM = 1, the divisor must have a 0 value in the MSB.
- If SXM = 0, any 16-bit divisor value produces the expected results.

The dividend, which is in *src*, must initially be positive (bit 31 must be 0) and must remain positive following the accumulator shift, which occurs in the first portion of the instruction.

This instruction affects OVA or OVB (depending on *src*) but is not affected by OVM; therefore, *src* does not saturate on positive or negative overflows when executing this instruction.

**Words**                    1 word

Add 1 word when using long-offset indirect addressing or absolute addressing with an *Smem*.

**Cycles**                    1 cycle

Add 1 cycle when using long-offset indirect addressing or absolute addressing with an *Smem*.

**Classes**

Class 3A (see page 3-5)

1	1	1	1	0	1	0	0	1	1	0	K	K	K	K	K

**Execution** (SP) – 1 → SP  
(PC) + 1 → TOS  
Interrupt vector specified by *K* → PC

**Status Bits** None

**Description** This instruction transfers program control to the interrupt vector specified by *K*. This instruction allows you to use your software to execute any interrupt service routine. For a list of interrupts and their corresponding *K* value, see your device datasheet.

This instruction pushes PC + 1 onto the data-memory location addressed by SP. This enables a return instruction to retrieve the pointer to the instruction after the trap from the data-memory location addressed by SP. This instruction is not maskable and is not affected by INTM nor does it affect INTM.

**Note:**

This instruction is not repeatable.

**Syntax**                    **XC** *n, cond* [, *cond* [, *cond* ]]

**Operands**                    *n* = 1 or 2

The following table lists the conditions (*cond* operand) for this instruction.

Cond	Description	Condition Code	Cond	Description	Condition Code
BIO	$\overline{BIO}$ low	0000 0011	NBIO	$\overline{BIO}$ high	0000 0010
C	C = 1	0000 1100	NC	C = 0	0000 1000
TC	TC = 1	0011 0000	NTC	TC = 0	0010 0000
AEQ	(A) = 0	0100 0101	BEQ	(B) = 0	0100 1101
ANEQ	(A) $\neq$ 0	0100 0100	BNEQ	(B) $\neq$ 0	0100 1100
AGT	(A) > 0	0100 0110	BGT	(B) > 0	0100 1110
AGEQ	(A) $\geq$ 0	0100 0010	BGEQ	(B) $\geq$ 0	0100 1010
ALT	(A) < 0	0100 0011	BLT	(B) < 0	0100 1011
ALEQ	(A) $\leq$ 0	0100 0111	BLEQ	(B) $\leq$ 0	0100 1111
AOV	A overflow	0111 0000	BOV	B overflow	0111 1000
ANOV	A no overflow	0110 0000	BNOV	B no overflow	0110 1000
UNC	Unconditional	0000 0000			

**Opcode**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	1	1	N	1	C	C	C	C	C	C	C	C

Syntax <i>n</i>	Opcode <i>N</i>
1	0
2	1

**Execution**                    If (*cond*)  
                                       Then  
                                       Next *n* instructions are executed  
                                       Else  
                                       Execute NOP for next *n* instructions

**Status Bits**                    None

**Description**

The execution of this instruction depends on the value of *n* and the selected conditions:

- If *n* = 1 and the condition(s) is met, the 1-word instruction following this instruction is executed.
- If *n* = 2 and the condition(s) is met, the one 2-word instruction or the two 1-word instructions following this instruction are executed.
- If the condition(s) is not met, one or two nops are executed depending on the value of *n*.

This instruction tests multiple conditions before executing and can test the conditions individually or in combination with other conditions. You can combine conditions from only one group as follows:

Group 1: You can select up to two conditions. Each of these conditions must be from a different category (category A or B); you cannot have two conditions from the same category. For example, you can test EQ and OV at the same time but you cannot test GT and NEQ at the same time. The accumulator must be the same for both conditions; you cannot test conditions for both accumulators with the same instruction. For example, you can test AGT and AOV at the same time, but you cannot test AGT and BOV at the same time.

Group 2: You can select up to three conditions. Each of these conditions must be from a different category (category A, B, or C); you cannot have two conditions from the same category. For example, you can test TC, C, and BIO at the same time but you cannot test NTC, C, and NC at the same time.

**Conditions for This Instruction**

Group 1		Group 2		
Category A	Category B	Category A	Category B	Category C
EQ	OV	TC	C	BIO
NEQ	NOV	NTC	NC	NBIO
LT				
LEQ				
GT				
GEQ				

This instruction and the two instruction words following this instruction are uninterruptible.

**Note:**

The conditions tested are sampled two full cycles before this instruction is executed. Therefore, if the two 1-word instructions or one 2-word instruction modifies the conditions, there is no effect on the execution of this instruction, but if the conditions are modified during the two slots, the interrupt operation using this instruction can cause undesirable results.

This instruction is not repeatable.

<b>Words</b>	1 word
<b>Cycles</b>	1 cycle
<b>Classes</b>	Class 1 (see page 3-3)
<b>Example</b>	<pre>XC 1, ALEQ MAR *AR1+ ADD A, DAT100</pre>

	<b>Before Instruction</b>	<b>After Instruction</b>
A	FF FFF FFF	FF FFF FFF
AR1	0032	0033

If the content of accumulator A is less than or equal to 0, AR1 is modified before the execution of the addition instruction.

**Syntax**

- 1: **XOR** *Smem*, *src*
- 2: **XOR** *#lk* [, *SHFT*], *src* [, *dst*]
- 3: **XOR** *#lk*, **16**, *src* [, *dst*]
- 4: **XOR** *src* [, *SHIFT*] [, *dst*]

**Operands**

*src*, *dst*:     A (accumulator A)  
                   B (accumulator B)

*Smem*:         Single data-memory operand

$0 \leq \text{SHFT} \leq 15$   
 $-16 \leq \text{SHIFT} \leq 15$   
 $0 \leq \text{lk} \leq 65\,535$

**Opcode**

1:

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	1	1	1	0	S	I	A	A	A	A	A	A	A

2:

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	0	S	D	0	1	0	1	S	H	F	T
16-bit constant															

3:

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	0	S	D	0	1	1	0	0	1	0	1
16-bit constant															

4:

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	0	S	D	1	1	0	S	H	I	F	T

**Execution**

- 1: (*Smem*) XOR (*src*) → *src*
- 2: *lk* << *SHFT* XOR (*src*) → *dst*
- 3: *lk* << 16 XOR (*src*) → *dst*
- 4: (*src*) << *SHIFT* XOR (*dst*) → *dst*

**Status Bits**         None

**Description**

This instruction executes an exclusive OR of the 16-bit single data-memory operand *Smem* (shifted as indicated in the instruction) with the content of the selected accumulator and stores the result in *dst* or *src*, as specified. For a left shift, the low-order bits are cleared and the high-order bits are not sign extended. For a right shift, the sign is not extended.

**Words**

Syntaxes 1 and 4: 1 word  
 Syntaxes 2 and 3: 2 words

Add 1 word when using long-offset indirect addressing or absolute addressing with an *Smem*.

**Cycles**

Syntaxes 1 and 4: 1 cycle  
Syntaxes 2 and 3: 2 cycles

Add 1 cycle when using long-offset indirect addressing or absolute addressing with an Smem.

**Classes**

Syntax 1: Class 3A (see page 3-5)  
Syntax 1: Class 3B (see page 3-6)  
Syntaxes 2 and 3: Class 2 (see page 3-4)  
Syntax 4: Class 1 (see page 3-3)

**Example 1**

XOR \*AR3+, A

	Before Instruction	After Instruction		
A	<table border="1"><tr><td>00 00FF 1200</td></tr></table>	00 00FF 1200	<table border="1"><tr><td>00 00FF 0700</td></tr></table>	00 00FF 0700

# Condition Codes

---

---

---

---

This appendix lists the conditions for conditional instructions (Table A–1) and the combination of conditions that can be tested (Table A–2). Conditional instructions can test conditions individually or in combination with other conditions. You can combine conditions from only one group as follows:

- Group 1: You can select up to two conditions. Each of these conditions must be from a different category (category A or B); you cannot have two conditions from the same category. For example, you can test EQ and OV at the same time but you cannot test GT and NEQ at the same time. The accumulator must be the same for both conditions; you cannot test conditions for both accumulators with the same instruction. For example, you can test AGT and AOV at the same time, but you cannot test AGT and BOV at the same time.
- Group 2: You can select up to three conditions. Each of these conditions must be from a different category (category A, B, or C); you cannot have two conditions from the same category. For example, you can test TC, C, and BIO at the same time but you cannot test NTC, C, and NC at the same time.

Table A–1. Conditions for Conditional Instructions

Operand	Condition	Description
AEQ	$A = 0$	Accumulator A equal to 0
BEQ	$B = 0$	Accumulator B equal to 0
ANEQ	$A \neq 0$	Accumulator A not equal to 0
BNEQ	$B \neq 0$	Accumulator B not equal to 0
ALT	$A < 0$	Accumulator A less than 0
BLT	$B < 0$	Accumulator B less than 0
ALEQ	$A \leq 0$	Accumulator A less than or equal to 0
BLEQ	$B \leq 0$	Accumulator B less than or equal to 0
AGT	$A > 0$	Accumulator A greater than 0
BGT	$B > 0$	Accumulator B greater than 0
AGEQ	$A \geq 0$	Accumulator A greater than or equal to 0
BGEQ	$B \geq 0$	Accumulator B greater than or equal to 0
AOV†	$AOV = 1$	Accumulator A overflow detected
BOV†	$BOV = 1$	Accumulator B overflow detected
ANOV†	$AOV = 0$	No accumulator A overflow detected
BNOV†	$BOV = 0$	No accumulator B overflow detected
C†	$C = 1$	ALU carry set to 1
NC†	$C = 0$	ALU carry clear to 0
TC†	$TC = 1$	Test/Control flag set to 1
NTC†	$TC = 0$	Test/Control flag cleared to 0
BIO†	$\overline{BIO}$ low	$\overline{BIO}$ signal is low
NBIO†	$\overline{BIO}$ high	$\overline{BIO}$ signal is high
UNC†	none	Unconditional operation

† Cannot be used with conditional store instructions

# CPU Status and Control Registers

This appendix shows the bit fields of the TMS320C54x™ CPU status and control registers. The C54x™ DSP has three status and control registers:

- Status register 0 (ST0)
- Status register 1 (ST1)
- Processor mode status register (PMST)

ST0 and ST1 contain the status of various conditions and modes; PMST contains memory-setup status and control information. Because these registers are memory-mapped, they can be stored into and loaded from data memory; the status of the processor can be saved and restored for subroutines and interrupt service routines (ISRs).

Table B–1 defines terms used in identifying the register fields.

*Table B–1. Register Field Terms and Definitions*

<b>Term</b>	<b>Definition</b>
ARP	Auxiliary register pointer
ASM	Accumulator shift mode
AVIS	Address visibility mode
BRAF	Block repeat active flag
C	Carry
CLKOFF	CLOCKOUT off
CMPT	Compatibility mode
CPL	Compiler mode
C16	Dual 16-bit/double-precision arithmetic mode
DP	Data page pointer
DROM	Data ROM
FRCT	Fractional mode

Table B–1. Register Field Terms and Definitions (Continued)

Term	Definition
HM	Hold mode
INTM	Interrupt mode
IPTR	Interrupt vector pointer
MP/ $\overline{MC}$	Microprocessor/microcomputer
OVA	Overflow flag A
OVB	Overflow flag B
OVLV	RAM overlay
OVM	Overflow mode
SMUL	Saturation on multiplication
SST	Saturation on store
SXM	Sign-extension mode
TC	Test/control flag
XF	External flag status

Figure B–1. Processor Mode Status Register (PMST)

† These bits are only supported on C54x devices with revision A or later, or on C54x devices numbered C548 or greater. You may also refer to the device-specific data sheet to determine if these bits are supported.

Figure B–2. Status Register 0 (ST0)

Figure B–3. Status Register 1 (ST1)

# Glossary

---

---

---

## A

**A:** See *accumulator A*.

**accumulator:** A register that stores the results of an operation and provides an input for subsequent arithmetic logic unit (ALU) operations.

**accumulator A:** One of two 40-bit registers that store the result of an operation and provide an input for subsequent arithmetic logic unit (ALU) operations.

**accumulator B:** One of two 40-bit registers that store the result of an operation and provide an input for subsequent arithmetic logic unit (ALU) operations.

**accumulator shift mode bits (ASM):** A 5-bit field in ST1 that specifies a shift value (from  $-16$  to  $15$ ) that is used to shift an accumulator value when executing certain instructions, such as instructions with parallel loads and stores.

**address:** The location of a word in memory.

**address visibility mode bit (AVIS):** A bit in PMST that determines whether or not the internal program address appears on the device's external address bus pins.

**addressing mode:** The method by which an instruction calculates the location of an object in memory.

**AG:** *Accumulator guard bits.* An 8-bit register that contains bits 39–32 (the guard bits) of an accumulator. Both accumulator A and accumulator B have guards bits.

**AH:** *Accumulator A high word.* Bits 31–16 of accumulator A.

**AL:** *Accumulator A low word.* Bits 15–0 of accumulator A.

**ALU:** *Arithmetic logic unit.* The part of the CPU that performs arithmetic and logic operations.

**AR0–AR7:** See *auxiliary registers*.

**ARAU:** See *auxiliary register arithmetic unit*.

**ARP:** See *auxiliary register pointer*.

**ASM:** See *accumulator shift mode bits*.

**auxiliary register arithmetic unit (ARAU):** An unsigned, 16-bit arithmetic logic unit (ALU) used to calculate indirect addresses using auxiliary registers.

**auxiliary register file:** The area in data memory containing the eight 16-bit auxiliary registers. See also *auxiliary registers*.

**auxiliary register pointer (ARP):** A 3-bit field in ST0 used as a pointer to the currently-selected auxiliary register, when the device is operating in 'C5x'/C2xx compatibility mode.

**auxiliary registers (AR0–AR7):** Eight 16-bit registers that are used as pointers to an address within data space. These registers are operated on by the auxiliary register arithmetic units (ARAUs) and are selected by the auxiliary register pointer (ARP). See also *auxiliary register arithmetic unit*.

**AVIS:** See *address visibility mode bit*.

## B

**B:** See *accumulator B*.

**barrel shifter:** A unit that rotates bits in a word.

**BG:** *Accumulator B guard bits.* An 8-bit register that contains bits 39–32 (the guard bits) of accumulator B.

**BH:** *Accumulator B high word.* Bits 31–16 of accumulator B.

**BL:** *Accumulator B low word.* Bits 15–0 of accumulator B.

**block-repeat active flag (BRAf):** A 1-bit flag in ST1 that indicates whether or not a block repeat is currently active.

**block-repeat counter (BRC):** A 16-bit register that specifies the number of times a block of code is to be repeated when a block repeat is performed.

**block-repeat end address register (REA):** A 16-bit memory-mapped register containing the end address of a code segment being repeated.

**block-repeat start address register (RSA):** A 16-bit memory-mapped register containing the start address of a code segment being repeated.

**boot:** The process of loading a program into program memory.

**boot loader:** A built-in segment of code that transfers code from an external source to program memory at power-up.

**BRC:** See *block-repeat counter*.

**butterfly:** A kernel function for computing an N-point fast Fourier transform (FFT), where N is a power of 2. The combinational pattern of inputs resembles butterfly wings.

## C

**C16:** A bit in ST1 that determines whether the ALU operates in dual 16-bit mode or in double-precision mode.

**CAB:** *C address bus*. A bus that carries addresses needed for accessing data memory.

**carry bit (C):** A bit used by the ALU in extended arithmetic operations and accumulator shifts and rotates. The carry bit can be tested by conditional instructions.

**CB:** *C bus*. A bus that carries operands that are read from data memory.

**CMPT:** See *compatibility mode bit*.

**code:** A set of instructions written to perform a task.

**cold boot:** The process of loading a program into program memory at power-up.

**compatibility mode bit (CMPT):** A bit in ST1 that determines whether or not the auxiliary register pointer (ARP) is used to select an auxiliary register in single indirect addressing mode.

**compiler mode bit (CPL):** A bit in ST1 that determines whether the CPU uses the data page pointer or the stack pointer to generate data memory addresses in direct addressing mode.

**CPL:** See *compiler mode bit*.

**D**

- DAB:** *D address bus.* A bus that carries addresses needed for accessing data memory.
- DAB address register (DAR):** A register that holds the address to be put on the DAB to address data memory for reads via the DB.
- DAGEN:** See *data address generation logic.*
- DAR:** See *DAB address register.*
- DARAM:** *Dual-access RAM.* Memory that can be accessed twice in the same clock cycle.
- data address bus:** A group of connections used to route data memory addresses. The C54x DSP has three 16-bit buses that carry data memory addresses: CAB, DAB, and EAB.
- data address generation logic (DAGEN):** Logic circuitry that generates the addresses for data memory reads and writes. See also *program address generation logic.*
- data bus:** A group of connections used to route data. The C54x DSP has three 16-bit data buses: CB, DB, and EB.
- data memory:** A memory region used for storing and manipulating data. Addresses 00h–1Fh of data memory contain CPU registers. Addresses 20h–5Fh of data memory contain peripheral registers.
- data page pointer (DP):** A 9-bit field in ST0 that specifies which of 512 128-word pages is currently selected for direct address generation. DP provides the nine MSBs of the data-memory address; the data memory address provides the lower seven bits. See also *direct memory address.*
- data ROM bit (DROM):** A bit in processor mode status register (PMST) that determines whether part of the on-chip ROM is mapped into program space.
- DB:** *D bus.* A bus that carries operands that are read from data memory.
- direct memory address (dma, DMA):** The seven LSBs of a direct-addressed instruction that are concatenated with the data page pointer (DP) to generate the entire data memory address. See also *data page pointer.*
- dma:** See *direct memory address.*
- DP:** See *data page pointer.*
- DROM:** See *data ROM bit.*

**E**

**EAB address register (EAR):** A register that holds the address to be put on the EAB to address data memory for reads via the EB.

**EAR:** See *EAB address register*.

**EB:** *E bus*. A bus that carries data to be written to memory.

**exponent (EXP) encoder:** A hardware device that computes the exponent value of the accumulator.

**F**

**fast return register (RTN):** A 16-bit register used to hold the return address for the fast return from interrupt (RETF[D]) instruction.

**fractional mode bit (FRCT):** A bit in status register ST1 that determines whether or not the multiplier output is left-shifted by one bit.

**FRCT:** See *fractional mode bit*.

**H**

**HM:** See *hold mode bit*.

**hold mode bit (HM):** A bit in status register ST1 that determines whether the CPU enters the hold state in normal mode or concurrent mode.

**I**

**IFR:** See *interrupt flag register*.

**IMR:** See *interrupt mask register*.

**instruction register (IR):** A 16-bit register used to hold a fetched instruction.

**interrupt:** A condition caused by internal hardware, an event external to the CPU, or by a previously executed instruction that forces the current program to be suspended and causes the processor to execute an interrupt service routine corresponding to the interrupt.

**interrupt flag register (IFR):** A 16-bit memory-mapped register used to identify and clear active interrupts.

**interrupt mask register (IMR):** A 16-bit memory-mapped register used to enable or disable external and internal interrupts. A 1 written to any IMR bit position enables the corresponding interrupt (when INTM = 0).

**interrupt mode bit (INTM):** A bit in status register ST1 that globally masks or enables all interrupts.

**interrupt service routine (ISR):** A module of code that is executed in response to a hardware or software interrupt.

**INTM:** See *interrupt mode bit*.

**IPTR:** *Interrupt vector pointer.* A 9-bit field in the processor mode status register (PMST) that points to the 128-word page where interrupt vectors reside.

**IR:** See *instruction register*.

**ISR:** See *interrupt service routine*.

## L

**latency:** The delay between when a condition occurs and when the device reacts to the condition. Also, in a pipeline, the delay between the execution of two instructions that is necessary to ensure that the values used by the second instruction are correct.

**LSB:** *Least significant bit.* The lowest order bit in a word.

## M

**memory-mapped register (MMR):** The C54x DSP processor registers mapped into page 0 of the data memory space.

**microcomputer mode:** A mode in which the on-chip ROM is enabled and addressable.

**microprocessor mode:** A mode in which the on-chip ROM is disabled.

**micro stack:** A stack that provides temporary storage for the address of the next instruction to be fetched when the program address generation logic is used to generate sequential addresses in data space.

**MP/ $\overline{\text{MC}}$  bit:** A bit in the processor mode status register (PMST) that indicates whether the processor is operating in microprocessor or microcomputer mode. See also *microcomputer mode*; *microprocessor mode*.

**MSB:** *Most significant bit.* The highest order bit in a word.

## O

**OVA:** *Overflow flag A.* A bit in status register ST0 that indicates the overflow condition of accumulator A.

**OVB:** *Overflow flag B.* A bit status register ST0 that indicates the overflow condition of accumulator B.

**overflow:** A condition in which the result of an arithmetic operation exceeds the capacity of the register used to hold that result.

**overflow flag (OVA, OVB):** A flag that indicates whether or not an arithmetic operation has exceeded the capacity of the corresponding accumulator. See also *OVA* and *OVB*.

**overflow mode bit (OVM):** A bit in status register ST1 that specifies how the ALU handles an overflow after an operation.

**OVLY:** See *RAM overlay bit*.

**OVM:** See *overflow mode bit*.

## P

**PAB:** *Program address bus.* A 16-bit bus that provides the address for program memory reads and writes.

**PAGEN:** See *program address generation logic*.

**PAR:** See *program address register*.

**PB:** *Program bus.* A bus that carries the instruction code and immediate operands from program memory.

**PC:** See *program counter*.

**pipeline:** A method of executing instructions in an assembly-line fashion.

**pmad:** *Program-memory address.* A 16-bit immediate program-memory address.

**PMST:** See *processor mode status register*.

**pop:** Action of removing a word from a stack.

**processor mode status register (PMST):** A 16-bit status register that controls the memory configuration of the device. See also *ST0*; *ST1*.

**program address generation logic (PAGEN):** Logic circuitry that generates the address for program memory reads and writes, and the address for data memory in instructions that require two data operands. This circuitry can generate one address per machine cycle. See also *data address generation logic*.

**program address register (PAR):** A register that holds the address to be put on the PAB to address memory for reads via the PB.

**program controller:** Logic circuitry that decodes instructions, manages the pipeline, stores status of operations, and decodes conditional operations.

**program counter (PC):** A 16-bit register that indicates the location of the next instruction to be executed.

**program counter extension register (XPC):** A register that contains the upper 7 bits of the current program memory address.

**program data bus (PB):** A bus that carries the instruction code and immediate operands from program memory.

**program memory:** A memory region used for storing and executing programs.

**push:** Action of placing a word onto a stack.

## R

**RAM overlay bit (OVLY):** A bit in the processor mode status register PMST that determines whether or not on-chip dual-access RAM is mapped into the program/data space.

**RC:** See *repeat counter*.

**REA:** See *block-repeat end address*.

**register:** A group of bits used for temporarily holding data or for controlling or specifying the status of a device.

**repeat counter (RC):** A 16-bit register used to specify the number of times a single instruction is executed.

**reset:** A means of bringing the CPU to a known state by setting the registers and control bits to predetermined values and signaling execution to start at a specified address.

**RSA:** See *block-repeat start address*.

**RTN:** See *fast return register*.

## S

**SARAM:** *Single-access RAM.* Memory that only can be read from or written during one clock cycle.

**shifter:** A hardware unit that shifts bits in a word to the left or to the right.

**sign-control logic:** Circuitry used to extend data bits (signed/unsigned) to match the input data format of the multiplier, ALU, and shifter.

**sign extension:** An operation that fills the high order bits of a number with the sign bit.

**sign-extension mode bit (SXM):** A bit in status register ST1 that enables sign extension in CPU operations.

**SINT:** See *software interrupt*.

**software interrupt:** An interrupt caused by the execution of an INTR or TRAP instruction.

**SP:** See *stack pointer*.

**ST0:** *Status register 0.* A 16-bit register that contains C54x CPU status and control bits. See also *PMST*; *ST1*.

**ST1:** *Status register 1.* A 16-bit register that contains C54x CPU status and control bits. See also *PMST*; *ST0*.

**stack:** A block of memory used for storing return addresses for subroutines and interrupt service routines and for storing data.

**stack pointer (SP):** A register that always points to the last element pushed onto the stack.

**SXM:** See *sign-extension mode bit*.

## T

**TC:** See *test/control flag bit*.

**temporary register (T):** A 16-bit register that holds one of the operands for multiply and store instructions, the dynamic shift count for the add and subtract instructions, or the dynamic bit position for the bit test instructions.

**test/control flag bit (TC):** A bit in status register ST0 that is affected by test operations.

**transition register (TRN):** A 16-bit register that holds the transition decision for the path to new metrics to perform the Viterbi algorithm.

## W

**warm boot:** The process by which the processor transfers control to the entry address of a previously-loaded program.

## X

**XF:** *XF status flag.* A bit in status register ST1 that indicates the status of the XF pin.

**XPC:** See *program counter extension register.*

## Z

**ZA:** *Zero detect bit A.* A signal that indicates when accumulator A contains a 0.

**ZB:** *Zero detect bit B.* A signal that indicates when accumulator B contains a 0.

**zero detect:** See *ZA* and *ZB*.

**zero fill:** A method of filling the low- or high-order bits with zeros when loading a 16-bit number into a 32-bit field.
