

---

**Novel Low Cost Green-Power PWM Controller**

---

**Features**

- Low Cost, PWM&PFM&CRM
- Low Start-up Current (about 10 $\mu$ A)
- Low Operating Current (about 2mA)
- Current Mode Operation
- Under Voltage Lockout (UVLO)
- Built-in Synchronized Slope Compensation
- Programmable PWM Frequency
- Leading edge Blanking on Sense input
- Constant output power limiting for universal AC input
- Cycle-by-cycle current limiting
- Clamped gate output voltage 16.5V
- Over voltage protect 26.7V
- High-Voltage CMOS Process with ESD
- SOT-23-6L、 SOP-8 & DIP-8 Pb-Free Packaging
- Compatible with SG5701 & SG5848 & LD7535 & OB22632/63

**Applications**

- Switching AC/DC Adaptor
- Battery Charger
- Open Frame Switching Power Supply
- 384X Replacement

**General Description**

The CR6848 is a highly integrated low cost current mode PWM controller, which is ideal for small power current mode of offline AC-DC fly-back converter applications. Making use of external resistors, the IC changes the operating frequency and automatically enters the PFM/CRM under light-load/zero-load conditions. This can minimize standby power consumption and achieve green-power functions. With a very low start-up current, the CR6848 could use a large value start-up resistor (1.5Mohm). Built-in synchronized slope compensation enhances the stability of the system and avoids sub-harmonic oscillation. Dynamic peak limiting circuit minimizes output power change caused by delay time of the system over a universal AC input range. Leading

edge blanking circuit on current sense input could remove the signal glitch due to snubber circuit diode reverse recovery and thus greatly reduces the external component count and system cost in the design. Pulse-by-pulse current limiting ensures safe operation even during short-circuit.

The CR6848 offers more protection like OVP (Over Voltage Protection) and OCP (Over current protection). The CR6848's output driver is clamped to maximum 16.5V to protect the power MOSFET. Excellent EMI performance is achieved soft switching control at the totem pole gate driver output. CR6848 is offered in SOT-23-6, SOP-8 and DIP-8 packages.

**CR68XX Series**

Part Number	PWM Frequency	Package	Description
CR6848	External Adjustable	DIP-8, SOP8 SOT-23-6L	PWM&PFM&CRM、Current Mode、Slope Compensation Leading-edge Blanking、Gate Clamped、Over-voltage Protection、Over-current Protection、Soft Drive.
CR6850	External Adjustable	DIP-8, SOP8 SOT-23-6L	With All Functions of CR6848、Gate soft Clamped
CR6851	External Adjustable	DIP-8, SOP8 SOT-23-6L	With All Functions of CR6850、Frequency jitter、Soft start、Sense Fault Protect、OLP、SCP、OTP

**TYPICAL APPLICATION**

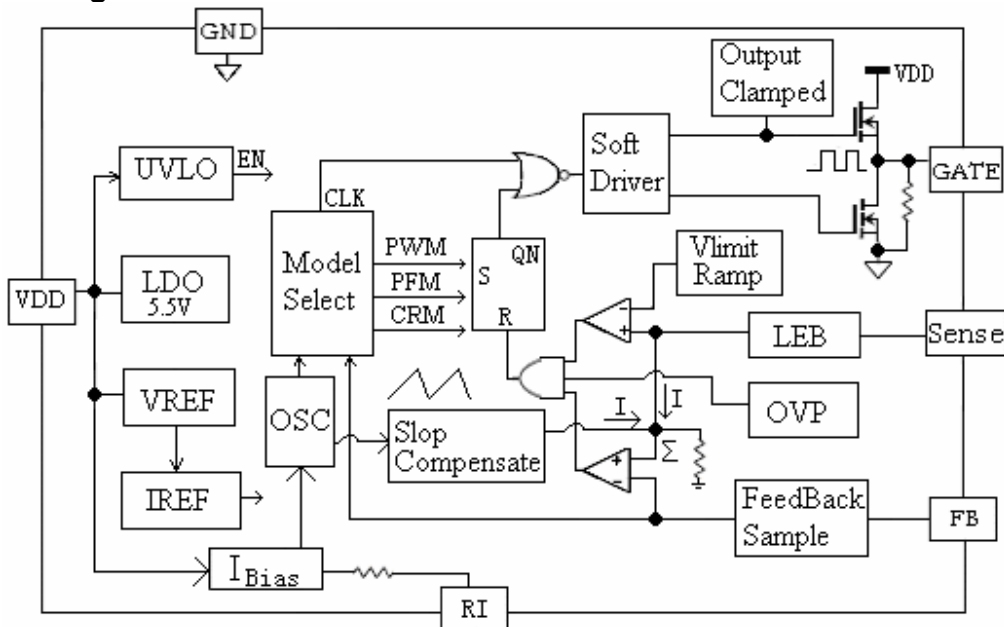

**Pin Assignment**

**Pin Descriptions**

Name	Description
GND	GND Pin
FB	Analog Input. Voltage feedback pin (same as the COMP pin in UC384X),
RI	This pin is to program the switching frequency. By connecting a resistor to ground to set the switching frequency.
SEN	Current sense pin, connect to sense the MOSFET current.
VDD	Supply voltage pin.
GATE	Gate output to drive the external power MOSFET.

**Block Diagram**

**Simplified Internal Circuit Architecture**

**Absolute Maximum Ratings**

Symbol	Parameter	Rating	Unit
V <sub>DD</sub>	Supply voltage Pin Voltage	40	V
I <sub>OVP</sub>	VDD OVP maximal enter current	20	mA
V <sub>FB</sub>	Input Voltage to FB Pin	-0.3 to 6V	V
V <sub>SEN</sub>	Input Voltage to SEN Pin	-0.3 to 6V	V
P <sub>D</sub>	Power Dissipation	300	mW

## OPERATION DESCRIPTION

### Current Model

Compared to voltage model control, current model control has a current feedback loop. When the voltage of the sense resistor peak current of the primary winding reaches the internal setting value  $V_{TH}$ , comparator reverse, register reset and power MOSFET cut-off. So that to detect and modulate the peak current cycle by cycle could control the output of the power supply. The current feedback has a good linear modulation rate and a fast input and output dynamic impact avoid the pole that the output filter inductance brings and the second class system descends to first class and so it widens the frequency range and optimizes overload protection and short circuit protection.

### Startup Current and Under Voltage Lockout

The startup current of CR6848 is set to be very low so that a large value startup resistor can therefore be used to minimize the power loss. For AC to DC adaptor with universal input range design, a 1.5 M $\Omega$ , 1/8 W startup resistor and a 10uF/25V VDD hold capacitor could be used.

The turn-on and turn-off threshold of the CR6848 is designed to 16.1V/11.1V. During startup, the hold-up capacitor must be charge to 16.1V through the startup resistor. The hysteresis is implemented to prevent the shutdown from the voltage dip during startup.

### Internal Bias and OSC Operation

A resistor connected between RI pin and GND pin set the internal constant current source to charge or discharge the internal fixed cap. The charge time and discharge time determine the internal clock speed and the switching frequency. Increasing the resistance will reduce the value of the input current and reduce the switching frequency. The relationship between RI pin and PWM switching frequency follows the below equation within the RI allowed range.

$$F_{osc} = \frac{5800}{RI(K\Omega)} (kHz)$$

For example, a 100k $\Omega$  resistor RI could generate a 50uA constant current and a 58kHz PWM switching frequency. The

suggested operating frequency range of CR6848 is within 48KHz to 100KHz.

### Green Power Operation

The power dissipation of switching mode power supply is very important in zero load or light load condition. The major dissipation result from conduction loss, switching loss and consume of the control circuit. However, all of them related to the switching frequency. There are many difference topologies has been implemented in different chip. The basic operation theory of all these approaches intended to reduce the switching frequency under light-load or no-load condition.

CR6848's green power function adapts PWM, PFM and CRM combining modulation. When RI resistor is 100k, the PWM frequency is 58kHz in medium or heavy load operation. Through modifying the pulse width, CR6848 could control output voltage. The current of FB pin increases when the load is in light condition and the internal mode controller enters PFM&PWM when the feedback current is over 0.92mA. The operation frequency of oscillator is to descend gradually. The invariable frequency of oscillator is 11.6kHz when the feedback current is over 1.05mA. To decrease the standby consumption of the power supply, Chip-Rail introduces the Cycle Reset Mode technology; If the feedback current were over 1.1mA, mode controller of CR6848 would reset internal register all the time and cut off the gate pin, while the output voltage is lower than the set value, it would set register, gate pin operating again. Although the frequency of the internal OSC is invariable, the register would reset some pulses so that the practical frequency is decreased at the gate pin.

CR6848 Green-Power Function

**Internal Synchronized Slope Compensation**

Although there are more advantages of the current mode control than conventional voltage mode control, there are still several drawbacks of peak-sensing current-mode converter. Especially the open loop instability when it operates in higher than 50% of the duty-cycle. CR6848 is introduced an internal slope compensation adding voltage ramp to the current sense input voltage for PWM generation to solve this problem. It improves the close loop stability greatly at CCM, prevents the sub-harmonic oscillation and thus reduces the output ripple voltage.

$$V_{SLOP} = 0.33 \times \frac{DUTY}{DUTY_{MAX}} = 0.4389 \times DUTY$$

**Current Sensing & Dynamic peak limiting**

The current flowing by the power MOSFET comes in to being a voltage  $V_{SENSE}$  on the sense pin cycle by cycle, which compares to the internal reference voltage, controls the reverse of the internal register, limits the peak current  $I_{MAX}$  of the primary of the transformer.

The energy  $E = \frac{1}{2} \times L \times I_{MAX}^2$

deposited by the transformer. So adjusting the  $R_{SENSE}$  can set the Max output power of the power supple mode. The current flowing by the power MOSFET has an extra value

$$\Delta I = \frac{V_{IN}}{L_p} \times T_D$$

due to the system delay T that the current detected from the sense pin to power MOSFET cut off in the CR6848 (Among these,  $V_{IN}$  is the primary winding voltage of the transformer and  $L_p$  is the

primary wind inductance.  $V_{IN}$  ranges from 85VAC to 264VAC. To guarantee the output power is a constant for universal input AC voltage, there is a dynamic peak limit circuit to compensate the system delay T that the system delay brings on.

**Leading-edge Blanking (LEB)**

Each time the power MOSFET is switched on, a turn-on spike will inevitably occur at the sense pin, which would disturb the internal signal from the sampling of the  $R_{SENSE}$ . There is a 300n sec leading edge blanking time built in to avoid the effect of the turn-on spike and the power MOSFET cannot be switched off during this time. So that the conventional external RC filtering on sense input is no longer required.

**Over Voltage Protection (OVP)**

There is a 26.7V over-voltage protection circuit in the CR6848 to improve the credibility and extend the life of the chip. The GATE is to shutdown immediately when the voltage of the VDD is over 26.7V and the voltage of VDD is to descend rapidly.

**Gate Driver & Soft Clamped**

CR6848' output designs a totem pole to drive a periphery power MOSFET. The dead time is introduced to minimize the transfixion current when the output is drove. The NMOS is shut off when the other NMOS is turned on. The clamp technology is introduced to protect the periphery power MOSFET from breaking down.
