

1.5MHz, 600mA Synchronous **Step-Down Converter**

❖ GENERAL DESCRIPTION

The AX3502 is a high efficiency monolithic synchronous buck regulator using a 1.5MHz constant frequency, current mode architecture. The device is available in an adjustable version. Supply current with no load is 300 μ A and drops to <1 μ A in shutdown. The 2.5V to 5.5V input voltage range makes the AX3502 ideally suited for single Li-Ion battery-powered applications. 100% duty cycle provides low dropout operation,

Switching frequency is internally set at 1.5MHz, allowing the use of small surface mount inductors and capacitors. The internal synchronous switch increases efficiency and eliminates the need for an external Schottky diode. Low output voltages are easily supported with the 0.6V feedback reference voltage. The AX3502 can supply 600mA of load current at $V_{CC}=3V$. The AX3502 is available in a low profile 5-pin, SOT package.

❖ FEATURES

- 2.5V to 5.5V Input Voltage Range
- High Efficiency: Up to 96%
- 1.5MHz Constant Frequency Operation
- 600mA Output Current at $V_{CC}=3V$
- No Schottky Diode Required
- Low Dropout Operation: 100% Duty Cycle
- 0.6V Reference Allows Low Output Voltages
- Current Mode Operation for Excellent Line and Load Transient Response
- Current limit, Enable function
- Short Circuit Protect (SCP)
- Low Quiescent Current: 300 μ A
- $\leq 1\mu$ A Shutdown Current
- 5-pin, SOT-23 Pb-Free package

❖ **Absolute Maximum Ratings** (at $T_A=25^{\circ}\text{C}$)

Characteristics	Symbol	Rating	Unit
VCC Pin Voltage	V_{CC}	$V_{SS} - 0.3$ to $V_{SS} + 6$	V
Feedback Pin Voltage	V_{FB}	$V_{SS} - 0.3$ to $V_{CC} + 0.3$	V
RUN Pin Voltage	V_{RUN}	$V_{SS} - 0.3$ to $V_{CC} + 0.3$	V
Switch Pin Voltage	V_{SW}	$V_{SS} - 0.3$ to $V_{CC} + 0.3$	V
Peak SW Sink & Source Current	I_{PSW}	1.4	A
Operating Supply Voltage	V_{OP}	+2.5 to +5.5	V
Power Dissipation	PD	$(T_J - T_A) / \theta_{JA}$	mW
Storage Temperature Range	T_{ST}	-40 to +150	$^{\circ}\text{C}$
Operating Junction Temperature Range	T_J	-40 to +85	$^{\circ}\text{C}$
Thermal Resistance from Junction to case	θ_{JC}	100	$^{\circ}\text{C}/\text{W}$
Thermal Resistance from Junction to ambient	θ_{JA}	240	$^{\circ}\text{C}/\text{W}$

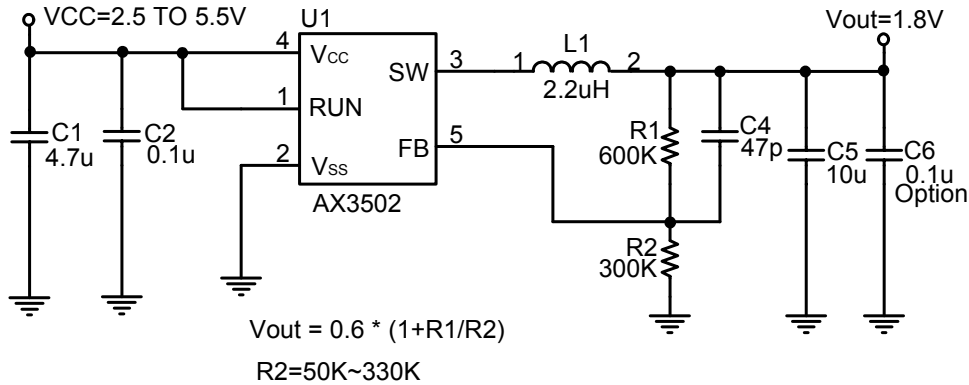

Note1: θ_{JA} is measured with the PCB copper area of approximately 1 in²(Multi-layer). that need connect to V_{SS} pin of the AX3502.

❖ **Electrical Characteristics** ($V_{IN} = V_{RUN}=3.6\text{V}$, $T_A = 25^{\circ}\text{C}$, unless otherwise specified)

Characteristics	Symbol	Conditions	Min	Typ	Max	Units
Feedback Voltage	V_{FB}	$T_A = 25^{\circ}\text{C}$, $I_{OUT}=50\text{mA}$	0.588	0.600	0.612	V
Quiescent Current	I_{CCQ}	$V_{FB}=0.5\text{V}$		270	400	μA
Feedback Bias Current	I_{FB}	$V_{FB}=0.65\text{V}$	-	-	± 30	nA
Shutdown Supply Current	I_{SD}	$V_{RUN} = 0\text{V}$	-	0.08	1	μA
Maximum Output Current	$I_{OUT(MAX)}$	$V_{CC} = 3\text{V}$	0.6			A
Current Limit	I_{LIMIT}	Duty Cycle=100% Current Pulse width <1ms	0.7	1.0	1.3	A
Line Regulation	$\Delta V_{OUT}/V_{OUT}$	$V_{CC} = 2.5\text{V}\sim 5.5\text{V}$	-	0.5	1	%
Load Regulation	$\Delta V_{OUT}/V_{OUT}$	$I_{OUT} = 0.01$ to 0.6A	-	0.4	0.6	%
Oscillation Frequency	F_{OSC}	SW pin	1.2	1.5	1.8	MHz
Frequency of SCP	F_{OSC1}	SW pin	-	300	-	KHz
$R_{DS(ON)}$ of P-CH MOSFET	$R_{DS(ON)}$	$I_{SW} = 300\text{mA}$		0.30	0.50	Ω
$R_{DS(ON)}$ of N-CH MOSFET	$R_{DS(ON)}$	$I_{SW} = -300\text{mA}$		0.20	0.45	Ω
Efficiency	EFFI	$V_{OUT}=1.8\text{V}$, $I_{OUT}=0.5\text{A}$		89		%
RUN Threshold	V_{RUN}		0.3	0.45	1.3	V
RUN Pin Input Current	I_{RUN}		-	± 0.1	± 1	μA

Note2: 100% production test at $+25^{\circ}\text{C}$. Specifications over the temperature range are guaranteed by design and characterization.

❖ Application Circuit

❖ Function Descriptions

Operation

AX3502 is a monolithic switching mode Step-Down DC-DC converter. It utilizes internal MOSFETs to achieve high efficiency and can generate very low output voltage by using internal reference at 0.6V. It operates at a fixed switching frequency, and uses the slope compensated current mode architecture. This Step-Down DC-DC Converter supplies 600mA output current at $V_{CC} = 3V$ with input voltage range from 2.5V to 5.5V.

Current Mode PWM Control

Slope compensated current mode PWM control provides stable switching and cycle-by-cycle current limit for excellent load and line responses and protection of the internal main switch (P-CH MOSFET) and synchronous rectifier (N-CH MOSFET). During normal operation, the internal P-CH MOSFET is turned on for a certain time to ramp the inductor current at each rising edge of the internal oscillator, and switched off when the peak inductor current is above the error voltage. The current comparator, I_{COMP} , limits the peak inductor current. When the main switch is off, the synchronous rectifier will be turned on immediately and stay on until either the inductor current starts to reverse, as indicated by the current reversal comparator, I_{ZERO} , or the beginning of the next clock cycle. The OVDET comparator controls output transient overshoots by turning the main switch off and keeping it off until the fault is no longer present.

❖ Function Descriptions

Idle Mode Operation

At very light loads, the AX3502 automatically enters Idle Mode. In the Idle Mode, the inductor current may reach zero or reverse on each pulse. The PWM control loop will automatically skip pulses to maintain output regulation. The bottom MOSFET is turned off by the current reversal comparator, I_{ZERO} and the switch voltage will ring. This is discontinuous mode operation, and is normal behavior for the switching regulator.

When the input voltage decreases toward the value of the output voltage, the AX3502 allows the main switch to remain on for more than one switching cycle and increases the duty cycle until it reaches 100%. The output voltage then is the input voltage minus the voltage drop across the main switch and the inductor. At low input supply voltage, the $R_{DS(ON)}$ of the P-CH MOSFET increases, and the efficiency of the converter decreases. Caution must be exercised to ensure the heat dissipated not to exceed the maximum junction temperature of the IC.

Maximum Load Current

The AX3502 will operate with input supply voltage as low as 2.5V, however, the maximum load current decreases at lower input due to large IR drop on the main switch and synchronous rectifier. The slope compensation signal reduces the peak inductor current as a function of the duty cycle to prevent sub-harmonic oscillations at duty cycles greater than 50%. Conversely the current limit increases as the duty cycle decreases.

❖ Application Information

Setting the Output Voltage

Application circuit item shows the basic application circuit with AX3502 adjustable output version. The external resistor sets the output voltage according to the following equation:

$$V_{OUT} = 0.6V \times \left(1 + \frac{R1}{R2}\right)$$

Table 1 Resistor select for output voltage setting

V _{OUT}	R2	R1
1.2V	300K	300K
1.5V	300K	450K
1.8V	300K	600K
2.5V	300K	950K

Inductor Selection

For most designs, the AX3502 operates with inductors of 1μH to 4.7μH. Low inductance values are physically smaller but require faster switching, which results in some efficiency loss. The inductor value can be derived from the following equation:

$$L = \frac{V_{OUT} \times (V_{IN} - V_{OUT})}{V_{IN} \times \Delta I_L \times f_{OSC}}$$

Where is inductor Ripple Current. Large value inductors lower ripple current and small value inductors result in high ripple currents. Choose inductor ripple current approximately 35% of the maximum load current 600mA, ΔI_L=210mA.

Table 2 Inductor select for output voltage setting (V_{CC}=3.6V)

V _{OUT}	1.2V	1.5V	1.8V	2.5V
Inductor	2.7uH	2.7uH	2.7uH	2.2uH
Part Number WE-TPC	7440430027	7440430027	7440430027	7440430022

Note: Part type MH or M (www.we-online.com)

For output voltages above 2.0V, when light-load efficiency is important, the minimum recommended inductor is 2.2μH. For optimum voltage-positioning load transients, choose an inductor with DC series resistance in the 50mΩ to 150mΩ range. For higher efficiency at heavy loads (above 200mA), or minimal load regulation (but some transient overshoot), the resistance should be kept below 100mΩ. The DC current rating of the inductor should be at least equal to the maximum load current plus half the ripple current to prevent core saturation (600mA+105mA).

Input Capacitor Selection

The input capacitor reduces the surge current drawn from the input and switching noise from the device. The input capacitor impedance at the switching frequency shall be less than input source impedance to prevent high frequency switching current passing to the input. A low ESR input capacitor sized for maximum RMS current must be used. Ceramic capacitors with X5R or X7R dielectrics are highly recommended because of their low ESR and small temperature coefficients. A 4.7 μ F ceramic capacitor for most applications is sufficient.

Output Capacitor Selection

The output capacitor is required to keep the output voltage ripple small and to ensure regulation loop stability. The output capacitor must have low impedance at the switching frequency. Ceramic capacitors with X5R or X7R dielectrics are recommended due to their low ESR and high ripple current.

Compensation Capacitor Selection

The compensation capacitors for increasing phase margin provide additional stability. It is required and more than 22p, Refer to Demo Board Schematic, The optimum values for C4 is 47pF.

Layout Guidance

When laying out the PC board, the following suggestions should be taken to ensure proper operation of the AX3502. These items are also illustrated graphically in below.

1. The power traces, including the GND trace, the SW trace and the V_{CC} trace should be kept short, direct and wide to allow large current flow. Put enough multiply-layer pads when they need to change the trace layer.
2. Connect the input capacitor C1&C2 to the V_{CC} pin as closely as possible to get good power filter effect.
3. Keep the switching node, SW, away from the sensitive FB node.
4. Do not trace signal line under inductor.
