

0.25V SWITCHING BUCK REGULATOR

GENERAL DESCRIPTION

The **FP7103** is PWM control buck converter designed to provide a simple, high efficiency solution for driving high power LEDs. With a **0.25V** reference voltage feedback control to minimize power dissipation, an external resistor sets the current as needed for driving various types of LEDs. The **FP7103** includes a high current P-MOSFET, high efficiency and excellent transient characteristics. The PWM control circuit is able to the duty ratio linearly from 0 up to 100%. The features include user accessible EN/DIM pin for enabling and PWM dimming of LEDs, thermal shutdown, cycle-by-cycle current limit and over current protection.

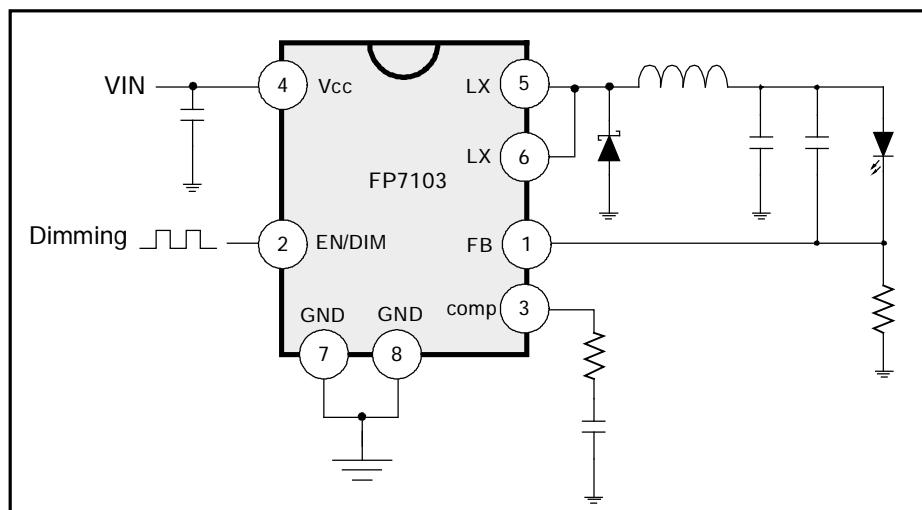

FEATURES

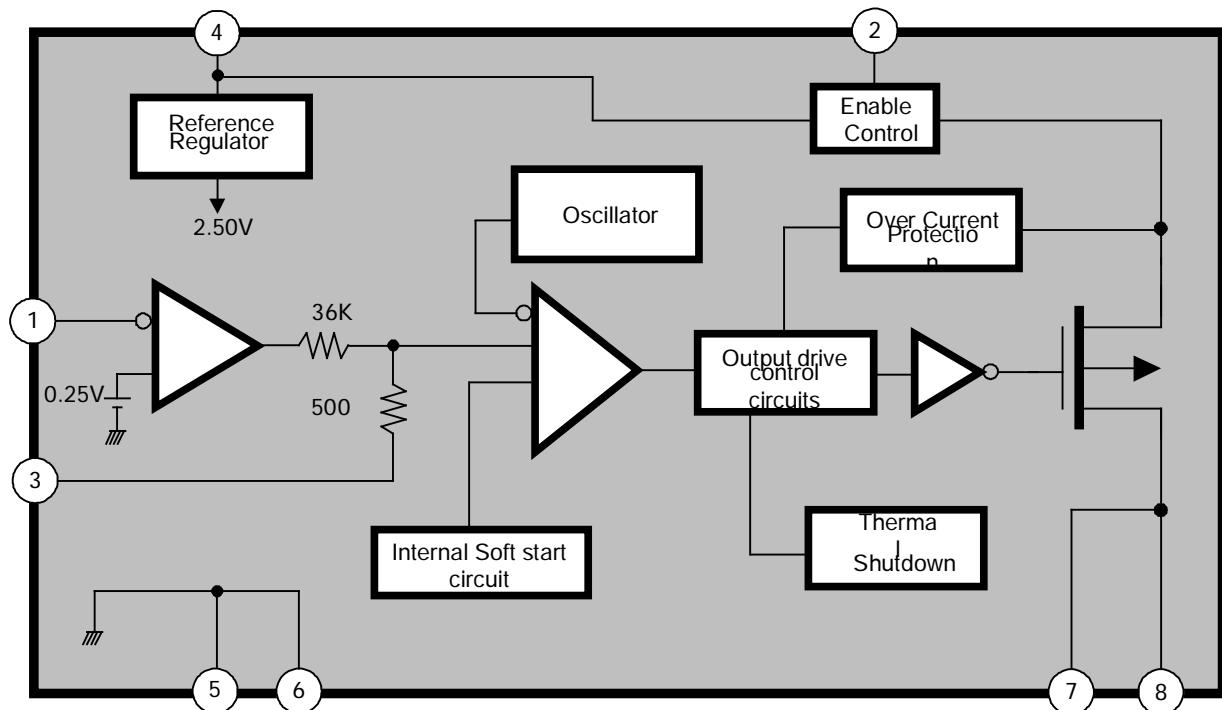

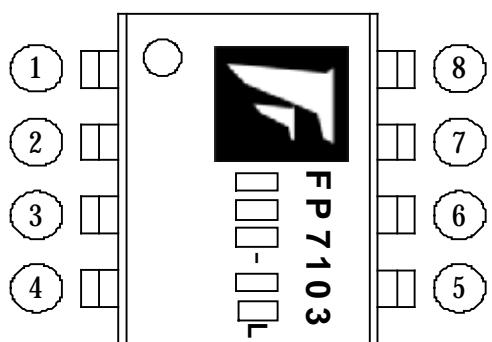

- Precision feedback reference voltage: 0.25V (2%)
- Wide supply voltage operating range: 3.6 to 28V
- Low current consumption: 4mA
- Internal fixed oscillator frequency: Typ. 320KHz
- Internal Soft-Start function (SS)
- Built-in P-MOSFET for 3A loading capability
- Over Current Protection
- Package: SOP8

DETAILED DESCRIPTION

Voltage Reference

A 2.5V reference regulator supplies **FP7103** internal circuits and uses the resistive dividers to provide a **0.25V** precision reference voltage on the non-inverting terminal of error amplifier.

Setting the LED Current

FP7103 is a constant current buck regulator. The LEDs are connected between V_{OUT} and FB pin as shown in the Typical Application Circuit. The FB pin is at **0.25V** in regulation and therefore the LEDs current I_F is set by V_{FB} and the resistor R_2 from FB to ground by the following equation:

$$I_F = \frac{V_{FB}}{R_2}$$

I_F should not exceed the 3A current capability of **FP7103** and therefore R_2 minimum must be approximately 0.13Ω .

Output Voltage

The output voltage is primarily determined by the number of LEDs(n) connected from V_{OUT} to FB pin and therefore V_{OUT} can be written as:

$$V_{OUT} = ((n \times V_F) + V_{FB})$$

where V_F is the forward voltage of one LED at the set LED current level (see LED manufacturer datasheet for forward characteristics curve).

Oscillator

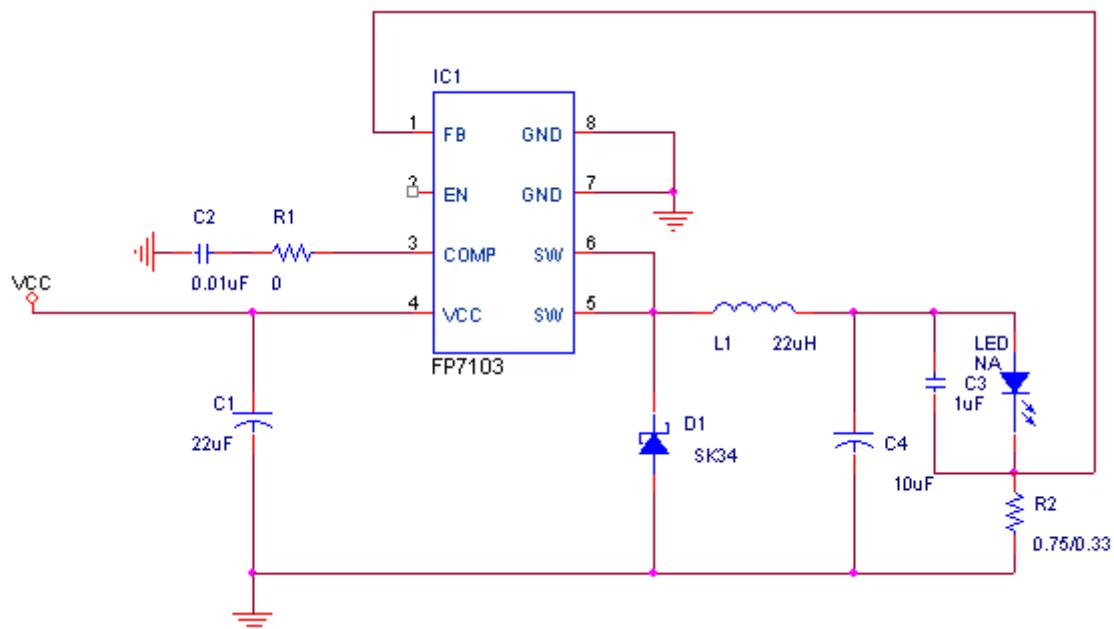

The fixed frequency generates from an internal oscillator, and the typical values are **320KHz**.

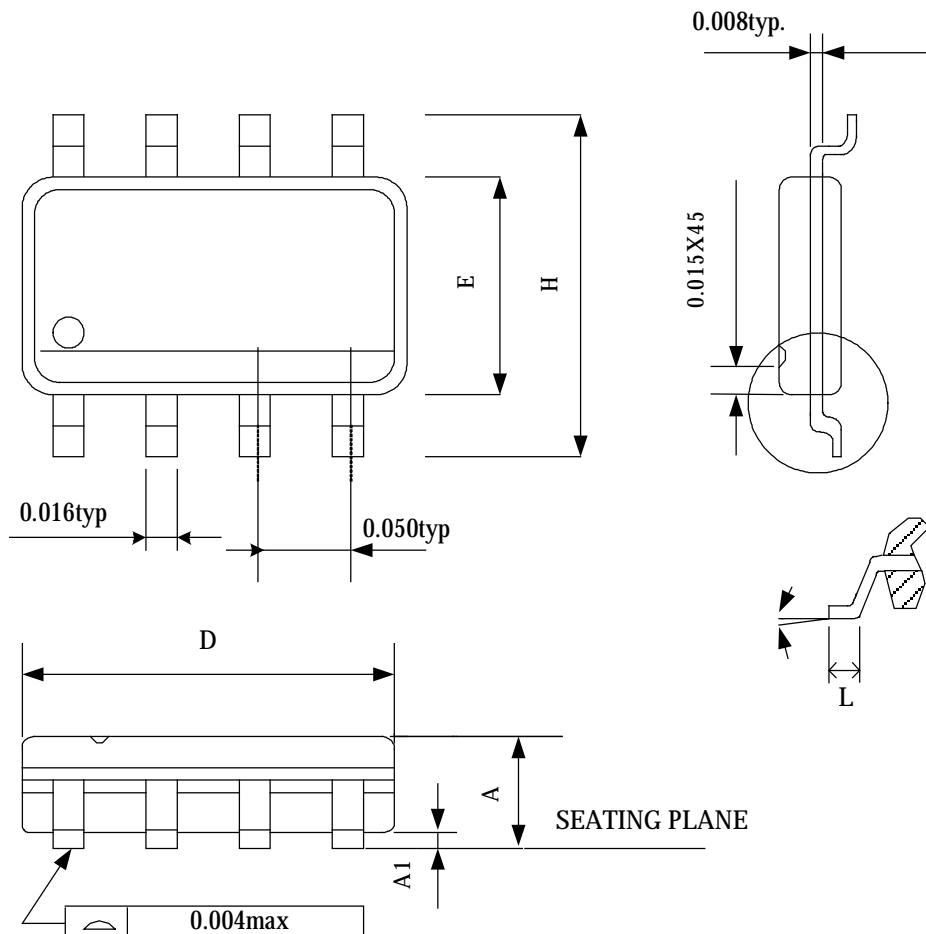

Thermal Protection

The thermal protection is functional due to a heavy loading drop and junction temperature achieve 150 °C, then **FP7103** output turn off. When junction temperature is lower than 150 °C, **FP7103** starts again and power switch turns on.

Over Current Protection

The **FP7103** uses cycle-by-cycle current limit to protect the internal power switch. During each switching cycle, a current limit comparator detects if the power switch current exceeds the internal setting current, and begins over current protection decrease the oscillator frequency to prevent thermal issue.
