μ_i Initial permeability

The initial permeability μ_i is the limit value at the initial magnetization curve's origin point and is given by the following formula:

$$\mu_i = \frac{1}{\mu_0} \lim_{H \rightarrow 0} \frac{B}{H}$$

μ_0 : Permeability of vacuum

H: Magnetic field strength(A/m)

B: Magnetic flux density(T)

μ_e Effective permeability

This is usually defined as the permeability of a core forming a closed circuit where leakage flux is negligibly small.

$$\mu_e = \frac{L}{\mu_0 N^2} \cdot \frac{Le}{Ae}$$

Bs Saturation magnetic flux density (T)

The magnetic flux density at a magnetic field where H is up to an approximate saturation magnetic field value.

Br Residual magnetic flux density

The value of flux density retained by the core where the magnetic field is reduced from the state of the effective saturation magnetic flux density to zero.

He Coercivity (A/m)

The value of magnetic field strength where by the flux density becomes zero under the intensification, in the opposite direction, of the magnetic field.

Tan δ/μ Relative loss factor

This is the ratio of loss factor to permeability

Q Quality factor

This is the reciprocal of the loss factor and is given by

$$Q=1/\tan\delta$$

Tc Curie temperature

This is the temperature coefficient per unit permeability and is given by the following equation:

D_f Disaccommodation factor

This is the factor representing the variation of permeability through time after a complete demagnetization of the core at a constant temperature.

$$D_f = \frac{\mu_{i1} - \mu_{i2}}{\mu_{i1}^2} \times \frac{1}{\log(t_f/t_i)}$$

ρ Electrical resistivity(Ω/m)

This is the electrical resistance per unit length and cross-sectional area of a magnetic core.

d This is the weight per unit volume of a magnetic core

$$d=W/V$$

W: weight of magnetic body(kg)

V: volume of magnetic body(m^3)

A_I Inductance factor

This is the inductance per turn of the coil wound around the ferrite cores with definite shape and dimension.

$$A_L=L/N^2$$

L: inductance of the coil with ferrite core
N: turns of the coil

Effective Core Parameters

$$C_1=\sum L/A(cm^{-1})$$

The summation of the magnetic path lengths of each section of a magnetic circuit divided by the corresponding magnetic area of the same section.

$$C_2=\sum L/A^2(cm^{-3})$$

$Le=C_1^2/C_2(cm)$ Effective magnetic path length

$Ae=C_1/C_2(cm^2)$ Effective magnetic path length

$Ae=C_1^3/C_2^2(cm^3)$ Effective magnetic path length

$Aw(mm^2)$ Winding area of core

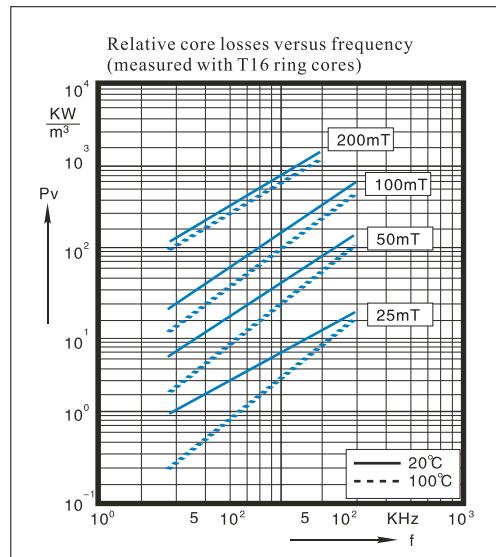

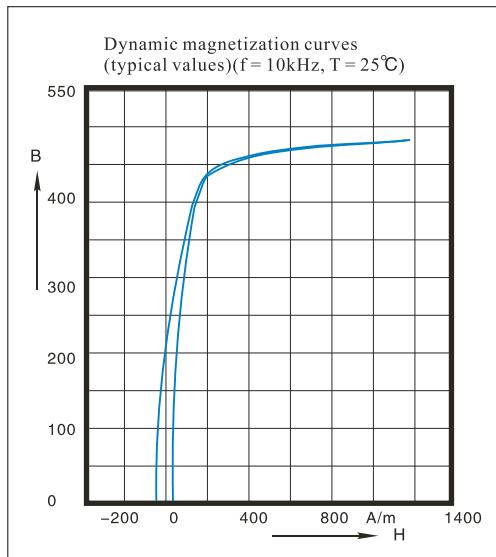

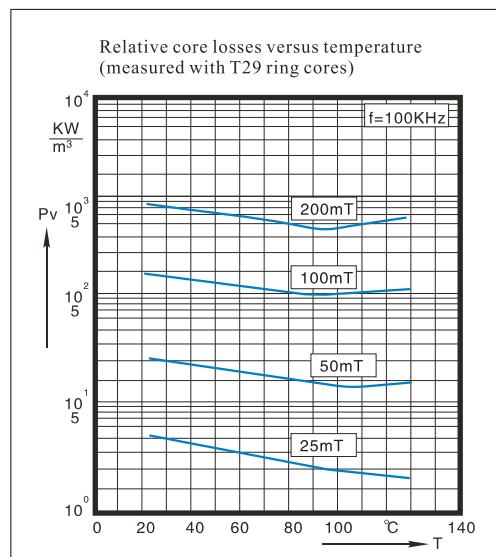

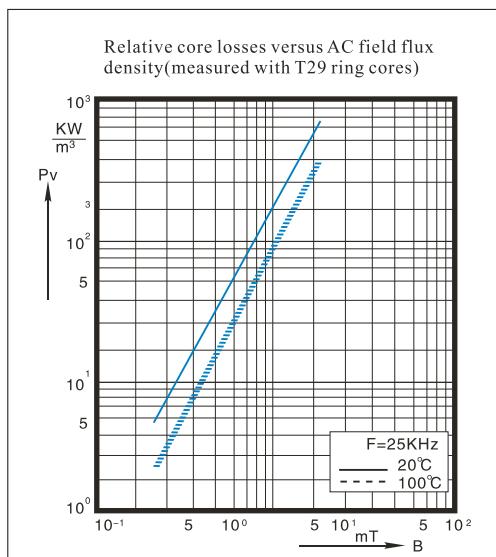

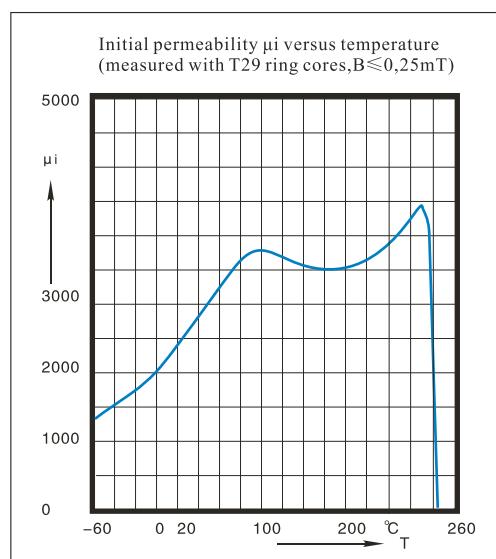

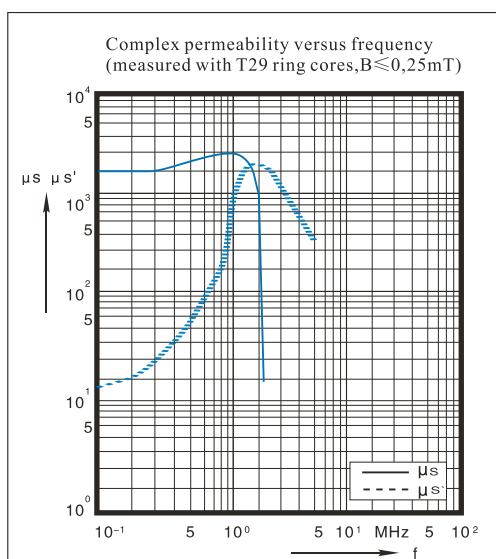

$Ac(mm^2)$ cross-sectional centre leg area

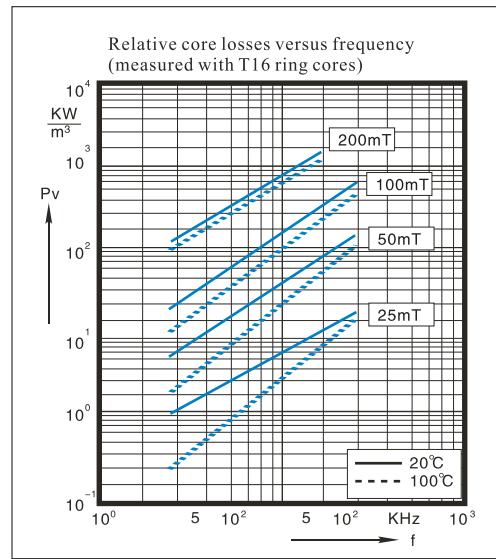

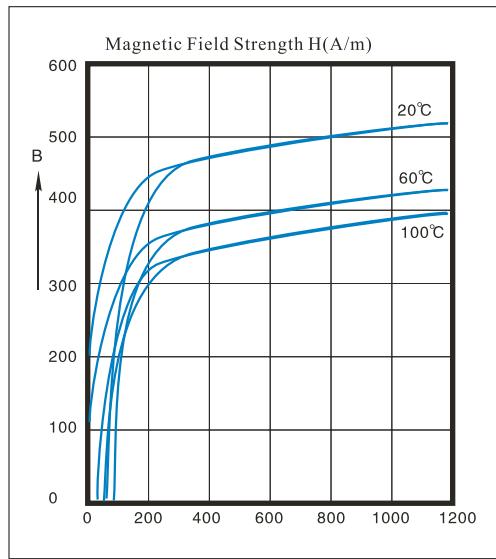

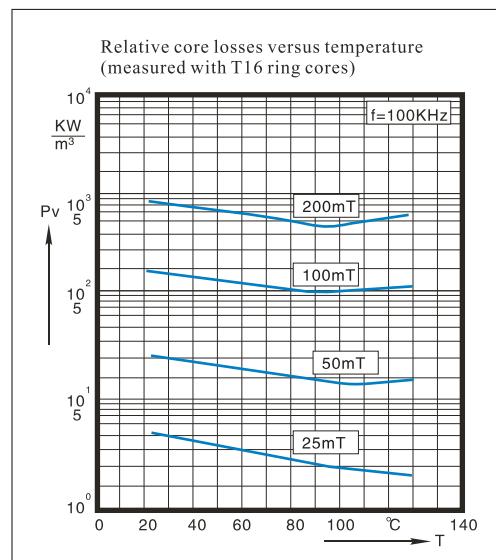

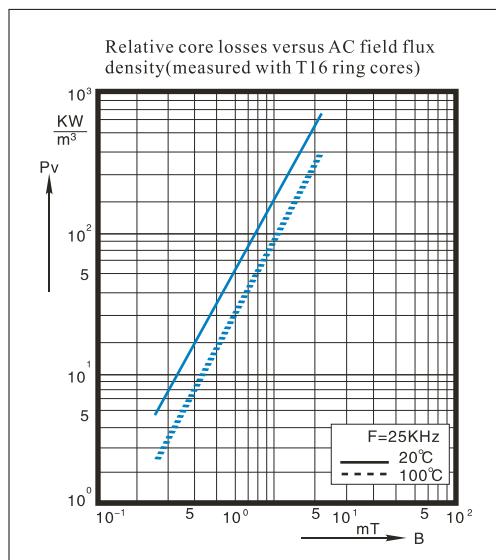

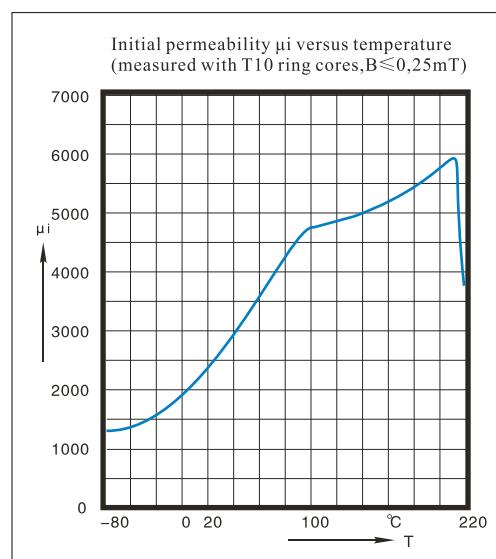

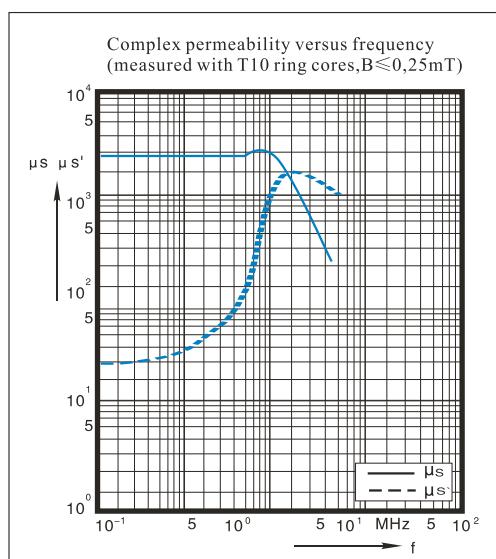

$W(g)$ Approx. weight of core
