FEATURES

- < 30-mW No-Load Power for 5-Star Rating
- Primary-Side Regulation (PSR) Eliminates Opto-Coupler
- ±5% Voltage and Current Regulation
- 130-kHz Maximum Switching Frequency Enables High-Power Density Charger Designs
- Quasi-Resonant Valley-Switching Operation for Highest Overall Efficiency
- Patent-Pending Frequency-Jitter Scheme to Ease EMI Compliance
- Wide VDD Range Allows Small Bias Capacitor
- Clamped Gate-Drive Output for MOSFET
- Protection Functions: Over-Voltage, Low-Line, and Over-Current
- Programmable Cable Compensation (UCC28700 only)
- NTC Resistor Interface (UCC28701, UCC28702 and UCC28703 only) with Fixed Cable Compensation Options
- SOT23-6 Package

APPLICATIONS

- USB-Compliant Adapters and Chargers for Consumer Electronics (cell phones, tablets and cameras)
- AC and DC Power Supplies

DESCRIPTION

The UCC28700 family of flyback power supply controllers provides Constant-Voltage (CV) and Constant-Current (CC) output regulation without the use of an optical coupler. The devices process information from the primary power switch and an auxiliary flyback winding for precise control of output voltage and current. Low start-up current, dynamically-controlled operating states and a tailored modulation profile support very low stand-by power without sacrificing start-up time or output transient response.

Control algorithms in the UCC28700 family allow operating efficiencies to meet or exceed applicable standards. The output drive interfaces to a MOSFET power switch. Discontinuous Conduction Mode (DCM) with valley switching reduces switching losses. Modulation of switching frequency and primary current peak amplitude (FM and AM) keeps the conversion efficiency high across the entire load and line ranges.

The controllers have a maximum switching frequency of 130 kHz and always maintain control of the peak-primary current in the transformer. Protection features help keep primary and secondary component stresses in check. The UCC28700 allows the level of cable compensation to be programmed. The UCC28701, UCC28702 and UCC28703 devices allow remote temperature sensing using a Negative Temperature Coefficient (NTC) resistor while providing fixed cable-compensation levels.

\(^{(1)}\) Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability. All voltages are with respect to GND. Currents are positive into, negative out of the specified terminal. These ratings apply over the operating ambient temperature ranges unless otherwise noted.

\(^{(1)}\) For more information about traditional and new thermal metrics, see the IC Package Thermal Metrics application report, SPRA953.

\(^{(2)}\) The junction-to-ambient thermal resistance under natural convection is obtained in a simulation on a JEDEC-standard, high-K board, as specified in JESD51-7, in an environment described in JESD51-2a.

\(^{(3)}\) The junction-to-case (top) thermal resistance is obtained by simulating a cold plate test on the package top. No specific JEDEC-standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.

\(^{(4)}\) The junction-to-board thermal resistance is obtained by simulating in an environment with a ring cold plate fixture to control the PCB temperature, as described in JESD51-8.

\(^{(5)}\) The junction-to-top characterization parameter, \(\psi\)\text{\textsubscript{JT}}, estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining \(\theta\)\text{\textsubscript{JA}} using a procedure described in JESD51-2a (sections 6 and 7).

\(^{(6)}\) The junction-to-board characterization parameter, \(\psi\)\text{\textsubscript{JB}}, estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining \(\theta\)\text{\textsubscript{JA}}, using a procedure described in JESD51-2a (sections 6 and 7).

</tr>
</tbody>
</table>
Detailed Pin Description

VDD (Device Bias Voltage Supply): The VDD pin is connected to a bypass capacitor to ground and a start-up resistance to the input bulk capacitor (+) terminal. The VDD turn-on UVLO threshold is 21 V and turn-off UVLO threshold is 8.1 V, with an available operating range up to 35 V. The USB charging specification requires the output current to operate in constant-current mode from 5 V to a minimum of 2 V; this is easily achieved with a nominal VDD of approximately 25 V. The additional VDD headroom up to 35 V allows for VDD to rise due to the leakage energy delivered to the VDD capacitor in high-load conditions. Also, the wide VDD range provides the advantage of selecting a relatively small VDD capacitor and high-value start-up resistance to minimize no-load stand-by power loss in the start-up resistor.

GND (Ground): This is a single ground reference external to the device for the gate drive current and analog signal reference. Place the VDD bypass capacitor close to GND and VDD with short traces to minimize noise on the VS and CS signal pins.

VS (Voltage-Sense): The VS pin is connected to a resistor divider from the auxiliary winding to ground. The output-voltage feedback information is sampled at the end of the transformer secondary current demagnetization time to provide an accurate representation of the output voltage. Timing information to achieve valley-switching and to control the duty cycle of the secondary transformer current is determined by the waveform on the VS pin. Avoid placing a filter capacitor on this input which would interfere with accurate sensing of this waveform. The VS pin also senses the bulk capacitor voltage to provide for AC-input run and stop thresholds, and to compensate the current-sense threshold across the AC-input range. This information is sensed during the MOSFET on-time. For the AC-input run/stop function, the run threshold on VS is 220 µA and the stop threshold is 80 µA. The values for the auxiliary voltage divider upper-resistor $R_{S1}$ and lower-resistor $R_{S2}$ can be determined by the equations below.

$$R_{S1} = \frac{V_{N(run)} \times \sqrt{2}}{N_{PA} \times I_{VSL(run)}}$$

where

- $N_{PA}$ is the transformer primary-to-auxiliary turns ratio,
- $V_{N(run)}$ is the AC RMS voltage to enable turn-on of the controller (run),
- $I_{VSL(run)}$ is the run-threshold for the current pulled out of the VS pin during the MOSFET on-time. (see ELECTRICAL CHARACTERISTICS) \(\text{(1)}\)

$$R_{S2} = \frac{R_{S1} \times V_{VS}}{N_{AS} \times (V_{OCV} + V_F) - V_{VSR}}$$

where

- $V_{OCV}$ is the converter regulated output voltage,
- $V_F$ is the output rectifier forward drop at near-zero current,
- $N_{AS}$ is the transformer auxiliary to secondary turns ratio,
- $R_{S1}$ is the VS divider high-side resistance,
- $V_{VSR}$ is the CV regulating level at the VS input (see ELECTRICAL CHARACTERISTICS). \(\text{(2)}\)

DRV (Gate Drive): The DRV pin is connected to the MOSFET gate pin, usually through a series resistor. The gate driver provides a gate-drive signal limited to 14 V. The turn-on characteristic of the driver is a 25-mA current source which limits the turn-on dv/dt of the MOSFET drain and reduces the leading-edge current spike, but still provides gate-drive current to overcome the Miller plateau. The gate-drive turn-off current is determined by the low-side driver $R_{DS(on)}$ and any external gate-drive resistance. The user can reduce the turn-off MOSFET drain dv/dt by adding external gate resistance.
CS (Current Sense): The current-sense pin is connected through a series resistor ($R_{CS}$) to the current-sense resistor ($R_{LC}$). The current-sense threshold is 0.75 V for $I_{PP(\text{max})}$ and 0.25 V for $I_{PP(\text{min})}$. The series resistor $R_{LC}$ provides the function of feed-forward line compensation to eliminate change in $I_{PP}$ due to change in $\text{di/dt}$ and the propagation delay of the internal comparator and MOSFET turn-off time. There is an internal leading-edge blanking time of 235 ns to eliminate sensitivity to the MOSFET turn-on current spike. It should not be necessary to place a bypass capacitor on the CS pin. The value of $R_{CS}$ is determined by the target output current in constant-current (CC) regulation. The values of $R_{CS}$ and $R_{LC}$ can be determined by the equations below. The term $\eta_{XFMR}$ is intended to account for the energy stored in the transformer but not delivered to the secondary. This includes transformer resistance and core loss, bias power, and primary-to-secondary leakage ratio.

Example: With a transformer core and winding loss of 5%, primary-to-secondary leakage inductance of 3.5%, and bias power to output power ratio of 1.5%. The $\eta_{XFMR}$ value is approximately: $1 - 0.05 - 0.035 - 0.015 = 0.9$.

$$R_{CS} = \frac{V_{CCR} \times N_{PS}}{2I_{OCC}} \times \eta_{XFMR}$$

where
- $V_{CCR}$ is a current regulation constant (see ELECTRICAL CHARACTERISTICS),
- $N_{PS}$ is the transformer primary-to-secondary turns ratio (a ratio of 13 to 15 is recommended for 5-V output),
- $I_{OCC}$ is the target output current in constant-current regulation,
- $\eta_{XFMR}$ is the transformer efficiency.

$$(3)$$

$$R_{LC} = \frac{K_{LC} \times R_{S1} \times R_{CS} \times T_{D} \times N_{PA}}{L_{P}}$$

where
- $R_{S1}$ is the VS pin high-side resistor value,
- $R_{CS}$ is the current-sense resistor value,
- $T_{D}$ is the current-sense delay including MOSFET turn-off delay, add ~50 ns to MOSFET delay,
- $N_{PA}$ is the transformer primary-to-auxiliary turns ratio,
- $L_{P}$ is the transformer primary inductance,
- $K_{LC}$ is a current-scaling constant (see ELECTRICAL CHARACTERISTICS).

$$(4)$$

CBC (Cable Compensation), Pin 1 UCC28700: The cable compensation pin is connected to a resistor to ground to program the amount of output voltage compensation to offset cable resistance. The cable compensation block provides a 0-V to 3-V voltage level on the CBC pin corresponding to 0 to $I_{OCC}$ output current. The resistance selected on the CBC pin programs a current mirror that is summed into the VS feedback divider therefore increasing the output voltage as $I_{OUT}$ increases. There is an internal series resistance of 28 kΩ to the CBC pin which sets a maximum cable compensation of a 5-V output to 400 mV when CBC is shorted to ground. The CBC resistance value can be determined by the equation below.

$$R_{CBC} = \frac{V_{CBC(\text{max})} \times 3 \text{kΩ} \times (V_{OCV} + V_{F})}{V_{VSR} \times V_{OCBC}} - 28 \text{kΩ}$$

where
- $V_{OC}$ is the output voltage,
- $V_{F}$ is the diode forward voltage,
- $V_{OCBC}$ is the target cable compensation voltage at the output terminals,
- $V_{CBC(\text{max})}$ is the maximum voltage at the cable compensation pin at the maximum converter output current (see ELECTRICAL CHARACTERISTICS),
- $V_{VSR}$ is the CV regulating level at the VS input (see ELECTRICAL CHARACTERISTICS).

NTC (NTC Thermistor Shut-down), Pin 1 UCC28701/2/3: These versions of the UCC28700 family utilize pin 1 for an external NTC thermistor to allow user-programmable external thermal shut-down. The shut-down threshold is 0.95 V with an internal 105-μA current source which results in a 9.05-kΩ thermistor shut-down threshold. These controllers have either zero or fixed internal cable compensation.

Figure 11. Over-Voltage Threshold vs. Temperature
The UCC28700 is a flyback power supply controller which provides accurate voltage and constant current regulation with primary-side feedback, eliminating the need for opto-coupler feedback circuits. The controller operates in discontinuous conduction mode with valley-switching to minimize switching losses. The modulation scheme is a combination of frequency and primary peak current modulation to provide high conversion efficiency across the load range. The control law provides a wide-dynamic operating range of output power to achieve the <30-mW stand-by power requirement.

Another feature beneficial to achieve low stand-by power without excessive start-up time is a wide operating VDD range to allow a high-value VDD start-up resistance and low-value VDD capacitance. During low-power operating ranges the device has power management features to reduce the device operating current at operating frequencies below 44 kHz. The UCC28700 controller includes features in the modulator to reduce the EMI peak energy of the fundamental switching frequency and harmonics. Accurate voltage and constant current regulation, fast dynamic response, and fault protection are achieved with primary-side control. A complete charger solution can be realized with a straightforward design process, low cost and low component count.

**Primary-Side Voltage Regulation**

Figure 12 illustrates a simplified flyback converter with the main voltage regulation blocks of the device shown. The power train operation is the same as any DCM flyback circuit but accurate output voltage and current sensing is the key to primary-side control.

In primary-side control, the output voltage is sensed on the auxiliary winding during the transfer of transformer energy to the secondary. As shown in Figure 13 it is clear there is a down slope representing a decreasing total rectifier V_F and resistance voltage drop (I_S R_S) as the secondary current decreases to zero. To achieve an accurate representation of the secondary output voltage on the auxiliary winding, the discriminator reliably blocks the leakage inductance reset and ringing, continuously samples the auxiliary voltage during the down slope after the ringing is diminished, and captures the error signal at the time the secondary winding reaches zero current. The internal reference on VS is 4.05 V; the resistor divider is selected as outlined in the VS pin description.

In primary-side control, the output voltage is sensed on the auxiliary winding during the transfer of transformer energy to the secondary. As shown in Figure 13 it is clear there is a down slope representing a decreasing total rectifier V_F and resistance voltage drop (I_S R_S) as the secondary current decreases to zero. To achieve an accurate representation of the secondary output voltage on the auxiliary winding, the discriminator reliably blocks the leakage inductance reset and ringing, continuously samples the auxiliary voltage during the down slope after the ringing is diminished, and captures the error signal at the time the secondary winding reaches zero current. The internal reference on VS is 4.05 V; the resistor divider is selected as outlined in the VS pin description.

Figure 13. Auxiliary Winding Voltage
The UCC28700 VS signal sampler includes signal discrimination methods to ensure an accurate sample of the output voltage from the auxiliary winding. There are however some details of the auxiliary winding signal to ensure reliable operation, specifically the reset time of the leakage inductance and the duration of any subsequent leakage inductance ring. Refer to Figure 14 below for a detailed illustration of waveform criteria to ensure a reliable sample on the VS pin. The first detail to examine is the duration of the leakage inductance reset pedestal, \( T_{LK\_RESET} \) in Figure 14. Since this can mimic the waveform of the secondary current decay, followed by a sharp downslope, it is important to keep the leakage reset time less than 500 ns for \( I_{PRI\_minimum} \), and less than 1.5 \( \mu s \) for \( I_{PRI\_maximum} \). The second detail is the amplitude of ringing on the \( V_{AUX} \) waveform following \( T_{LK\_RESET} \). The peak-to-peak voltage at the VS pin should be less than approximately 100 mV\(_{p-p}\) at least 200 ns before the end of the demagnetization time, \( t_{DM} \). If there is a concern with excessive ringing, it usually occurs during light or no-load conditions, when \( t_{DM} \) is at the minimum. The tolerable ripple on VS is scaled up to the auxiliary winding voltage by \( R_{S1} \) and \( R_{S2} \), and is equal to 100 mV \( \times (R_{S1} + R_{S2}) / R_{S2} \).

During voltage regulation, the controller operates in frequency modulation mode and amplitude modulation mode as illustrated in Figure 15 below. The internal operating frequency limits of the device are 130 kHz maximum and 1 kHz minimum. The transformer primary inductance and primary peak current chosen sets the maximum operating frequency of the converter. The output preload resistor and efficiency at low power determines the converter minimum operating frequency. There is no stability compensation required for the UCC28700 controller.
Primary-Side Current Regulation

Timing information at the VS pin and current information at the CS pin allow accurate regulation of the secondary average current. The control law dictates that as power is increased in CV regulation and approaching CC regulation the primary-peak current is at \( I_{PP(max)} \). Referring to Figure 16 below, the primary-peak current, turns ratio, secondary demagnetization time \( (t_{DM}) \), and switching period \( (T_{SW}) \) determine the secondary average output current. Ignoring leakage inductance effects, the average output current is given by Equation 6. When the average output current reaches the regulation reference in the current control block, the controller operates in frequency modulation mode to control the output current at any output voltage at or below the voltage regulation target as long as the auxiliary winding can keep VDD above the UVLO turn-off threshold.

\[
I_{OUT} = \frac{I_{PP}}{2} \times \frac{N_p}{N_s} \times \frac{t_{DM}}{T_{SW}}
\]

Figure 16. Transformer Currents

Figure 17. Typical Target Output V-I Characteristic
Valley-Switching

The UCC28700 utilizes valley-switching to reduce switching losses in the MOSFET, to reduce induced-EMI, and to minimize the turn-on current spike at the sense resistor. The controller operates in valley-switching in all load conditions unless the $V_{DS}$ ringing has diminished.

Referring to Figure 18 below, the UCC28700 operates in a valley-skipping mode in most load conditions to maintain an accurate voltage or current regulation point and still switch on the lowest available $V_{DS}$ voltage.

![Figure 18. Valley-Skipping Mode](image)

Start-Up Operation

Upon application of input voltage to the converter, the start-up resistor connected to VDD from the bulk capacitor voltage ($V_{BLK}$) charges the VDD capacitor. During charging of the VDD capacitor the device bias supply current is less than 1.5 µA. When VDD reaches the 21-V UVLO turn-on threshold, the controller is enabled and the converter starts switching. The initial three cycles are limited to $I_{PP(max)}$. This allows sensing any initial input or output faults with minimal power delivery. After the initial three cycles at minimum $I_{PP(min)}$, the controller responds to the condition dictated by the control law. The converter remains in discontinuous mode during charging of the output capacitor(s), maintaining a constant output current until the output voltage is in regulation.
Fault Protection

There is comprehensive fault protection incorporated into the UCC28700. Protection functions include:

- Output over voltage
- Input under voltage
- Internal over temperature
- Primary over-current fault
- CS pin fault
- VS pin fault

A UVLO reset and restart sequence applies for all fault protection events.

The output over-voltage function is determined by the voltage feedback on the VS pin. If the voltage sample on VS exceeds 115% of the nominal V\textsubscript{OUT}, the device stops switching and keeps the internal circuitry enabled to discharge the VDD capacitor to the UVLO turn-off threshold. After that, the device returns to the start state and a start-up sequence ensues.

The UCC28700 always operates with cycle-by-cycle primary peak current control. The normal operating range of the CS pin is 0.75 V to 0.25 V. There is additional protection if the CS pin reaches 1.5 V. This results in a UVLO reset and restart sequence. There is no leading-edge blanking on the 1.5-V threshold on CS.

The line input run and stop thresholds are determined by current information at the VS pin during the MOSFET on-time. While the VS pin is clamped close to GND during the MOSFET on-time, the current through R\textsubscript{S1} is monitored to determine a sample of the bulk capacitor voltage. A wide separation of run and stop thresholds allows clean start-up and shut-down of the power supply with the line voltage. The run current threshold is 220 µA and the stop current threshold is 80 µA.

The internal over-temperature protection threshold is 165°C. If the junction temperature reaches this threshold the device initiates a UVLO reset cycle. If the temperature is still high at the end of the UVLO cycle, the protection cycle repeats.

Protection is included in the event of component failures on the VS pin. If complete loss of feedback information on the VS pin occurs, the controller stops switching and restarts.
DESIGN PROCEDURE

This procedure outlines the steps to design a constant-voltage, constant-current flyback converter using the UCC28700 family of controllers. Refer to the Figure 19 for component names and network locations. The design procedure equations use terms that are defined below.

Definition of Terms

Capacitance Terms in Farads
- $C_{BULK}$: total input capacitance of $C_{B1}$ and $C_{B2}$.
- $C_{DD}$: minimum required capacitance on the VDD pin.
- $C_{OUT}$: minimum output capacitance required.

Duty Cycle Terms
- $D_{MAGCC}$: secondary diode conduction duty cycle in CC, 0.425.
- $D_{MAX}$: MOSFET on-time duty cycle.

Frequency Terms in Hertz
- $f_{LINE}$: minimum line frequency.
- $f_{MAX}$: target full-load maximum switching frequency of the converter.
- $f_{MIN}$: minimum switching frequency of the converter, add 15% margin over the $f_{SW(min)}$ limit of the device.
- $f_{SW(min)}$: minimum switching frequency (see ELECTRICAL CHARACTERISTICS).

Current Terms in Amperes
- $I_{OCC}$: converter output constant-current target.
- $I_{PP(max)}$: maximum transformer primary current.
- $I_{START}$: start-up bias supply current (see ELECTRICAL CHARACTERISTICS).
- $I_{TRAN}$: required positive load-step current.
- $I_{VSL(run)}$: VS pin run current (see ELECTRICAL CHARACTERISTICS).
Current and Voltage Scaling Terms
• $K_{AM}$: maximum-to-minimum peak primary current ratio (see ELECTRICAL CHARACTERISTICS).
• $K_{LC}$: current-scaling constant (see ELECTRICAL CHARACTERISTICS).

Transformer Terms
• $L_p$: transformer primary inductance.
• $N_{AS}$: transformer auxiliary-to-secondary turns ratio.
• $N_{PA}$: transformer primary-to-auxiliary turns ratio.
• $N_{PS}$: transformer primary-to-secondary turns ratio.

Power Terms in Watts
• $P_{IN}$: converter maximum input power.
• $P_{OUT}$: full-load output power of the converter.
• $P_{RSTR}$: VDD start-up resistor power dissipation.
• $P_{SB}$: total stand-by power.
• $P_{SB\_CONV}$: $P_{SB}$ minus start-up resistor and snubber losses.

Resistance Terms in $\Omega$
• $R_{CS}$: primary current programming resistance.
• $R_{ESR}$: total ESR of the output capacitor(s).
• $R_{PL}$: preload resistance on the output of the converter.
• $R_{S1}$: high-side VS pin resistance.
• $R_{S2}$: low-side VS pin resistance.
• $R_{STR}$: maximum start-up resistance to achieve the turn-on time target.
• $R_{STR\_VDD}$: VDD start-up resistance.

Timing Terms in Seconds
• $T_D$: current-sense delay including MOSFET turn-off delay; add 50 ns to MOSFET delay.
• $T_{DMAG\_MIN}$: minimum secondary rectifier conduction time.
• $T_{ON\_MIN}$: minimum MOSFET on time.
• $T_R$: resonant frequency during the DCM (discontinuous conduction mode) time.
• $T_{STR}$: converter start-up time requirement.
Voltage Terms in Volts

- **V_{BLK}**: highest bulk capacitor voltage for stand-by power measurement.
- **V_{BULK(min)}**: minimum voltage on C_{B1} and C_{B2} at full power.
- **V_{OCBC}**: target cable compensation voltage at the output terminals.
- **V_{CBC(max)}**: maximum voltage at the CBC pin at the maximum converter output current (see ELECTRICAL CHARACTERISTICS).
- **V_{CCR}**: constant-current regulating voltage (see ELECTRICAL CHARACTERISTICS).
- **V_{CST(max)}**: CS pin maximum current-sense threshold (see ELECTRICAL CHARACTERISTICS).
- **V_{CST(min)}**: CS pin minimum current-sense threshold (see ELECTRICAL CHARACTERISTICS).
- **V_{DD(off)}**: UVLO turn-off voltage (see ELECTRICAL CHARACTERISTICS).
- **V_{DD(on)}**: UVLO turn-on voltage (see ELECTRICAL CHARACTERISTICS).
- **V_{ODA}**: output voltage drop allowed during the load-step transient.
- **V_{DSPK}**: peak MOSFET drain-to-source voltage at high line.
- **V_{F}**: secondary rectifier forward voltage drop at near-zero current.
- **V_{FA}**: auxiliary rectifier forward voltage drop.
- **V_{LK}**: estimated leakage inductance energy reset voltage.
- **V_{OCV}**: regulated output voltage of the converter.
- **V_{OCC}**: target lowest converter output voltage in constant-current regulation.
- **V_{REV}**: peak reverse voltage on the secondary rectifier.
- **V_{RIPPLE}**: output peak-to-peak ripple voltage at full-load.
- **V_{VS}**: CV regulating level at the VS input (see ELECTRICAL CHARACTERISTICS).

AC Voltage Terms in V_{RMS}

- **V_{IN(max)}**: maximum input voltage to the converter.
- **V_{IN(min)}**: minimum input voltage to the converter.
- **V_{IN(run)}**: converter input start-up (run) voltage.

Efficiency Terms

- **\( \eta_{SB} \)**: estimated efficiency of the converter at no-load condition, not including start-up resistance or bias losses. For a 5-V USB charger application, 60% to 65% is a good initial estimate.
- **\( \eta \)**: converter overall efficiency.
- **\( \eta_{XFMR} \)**: transformer primary-to-secondary power transfer efficiency.
Stand-by Power Estimate

Assuming no-load stand-by power is a critical design parameter, determine estimated no-load power based on target converter maximum switching frequency and output power rating.

The following equation estimates the stand-by power of the converter.

\[
P_{SB\_CONV} = \frac{P_{OUT} \times f_{MIN}}{n_{SB} \times K_{AM} \times f_{MAX}}
\]  

(7)

For a typical USB charger application, the bias power during no-load is approximately 2.5 mW. This is based on 25-V VDD and 100-µA bias current. The output preload resistor can be estimated by \( V_{OCV} \) and the difference in the converter stand-by power and the bias power. The equation for output preload resistance accounts for bias power estimated at 2.5 mW.

\[
R_{PL} = \frac{V_{OCV}^2}{P_{SB\_CONV} - 2.5 \text{ mW}}
\]  

(8)

Typical start-up resistance values for \( R_{STR} \) range from 13 MΩ to 20 MΩ to achieve 1-s start-up time. The capacitor bulk voltage for the loss estimation is the highest voltage for the stand-by power measurement, typically 325 V_DCC.

\[
P_{RSTR} = \frac{V_{BLK}^2}{R_{STR}}
\]  

(9)

For the total stand-by power estimation add an estimated 2.5 mW for snubber loss to the start-up resistance and converter stand-by power loss.

\[
P_{SB} = P_{SB\_CONV} + P_{RSTR} + 2.5 \text{ mW}
\]  

(10)

Input Bulk Capacitance and Minimum Bulk Voltage

Determine the minimum voltage on the input capacitance, \( C_{B1} \) and \( C_{B2} \) total, in order to determine the maximum \( N_p \) to \( N_s \) turns ratio of the transformer. The input power of the converter based on target full-load efficiency, minimum input RMS voltage, and minimum AC input frequency are used to determine the input capacitance requirement.

Maximum input power is determined based on \( V_{OCV} \), \( I_{OCC} \), and the full-load efficiency target.

\[
P_{IN} = \frac{V_{OCV} \times I_{OCC}}{\eta}
\]  

(11)

The below equation provides an accurate solution for input capacitance based on a target minimum bulk capacitor voltage. To target a given input capacitance value, iterate the minimum capacitor voltage to achieve the target capacitance.

\[
C_{BULK} = \frac{2P_{IN} \times \left(0.25 + \frac{1}{2\pi} \times \arcsin \left(\frac{V_{BULK\(min\)}}{\sqrt{2} \times V_{IN\(min\)}}\right)\right)}{\left(2V_{IN\(min\)}^2 - V_{BULK\(min\)}^2\right) \times f_{LINE}}
\]  

(12)
Transformer Turns Ratio, Inductance, Primary-Peak Current

The maximum primary-to-secondary turns ratio can be determined by the target maximum switching frequency at full load, the minimum input capacitor bulk voltage, and the estimated DCM quasi-resonant time.

Initially determine the maximum available total duty cycle of the on time and secondary conduction time based on target switching frequency and DCM resonant time. For DCM resonant time, assume 500 kHz if you do not have an estimate from previous designs. For the transition mode operation limit, the period required from the end of secondary current conduction to the first valley of the $V_{DS}$ voltage is $\frac{1}{2}$ of the DCM resonant period, or 1 µs assuming 500-kHz resonant frequency. $D_{\text{MAX}}$ can be determined using the equation below.

$$D_{\text{MAX}} = 1 - \left( \frac{TR \times f_{\text{MAX}}}{2} \right) - D_{\text{MAGCC}}$$  \hspace{1cm} (13)

Once $D_{\text{MAX}}$ is known, the maximum turns ratio of the primary to secondary can be determined with the equation below. $D_{\text{MAGCC}}$ is defined as the secondary diode conduction duty cycle during constant-current, CC, operation. It is set internally by the UCC28700 at 0.425. The total voltage on the secondary winding needs to be determined; which is the sum of $V_{OCV}$, the secondary rectifier $V_F$, and the cable compensation voltage ($V_{OCBC}$). For the 5-V USB charger applications, a turns ratio range of 13 to 15 is typically used.

$$N_{PS(\text{max})} = \frac{D_{\text{MAX}} \times V_{\text{BULK(min)}}}{D_{\text{MAGCC}} \times (V_{OCV} + V_F + V_{OCBC})}$$  \hspace{1cm} (14)

Once an optimum turns ratio is determined from a detailed transformer design, use this ratio for the following parameters.

The UCC28700 controller constant-current regulation is achieved by maintaining a maximum $D_{\text{MAG}}$ duty cycle of 0.425 at the maximum primary current setting. The transformer turns ratio and constant-current regulating voltage determine the current sense resistor for a target constant current.

Since not all of the energy stored in the transformer is transferred to the secondary, a transformer efficiency term is included. This efficiency number includes the core and winding losses, leakage inductance ratio, and bias power ratio to rated output power. For a 5-V, 1-A charger example, bias power of 1.5% is a good estimate. An overall transformer efficiency of 0.9 is a good estimate to include 3.5% leakage inductance, 5% core and winding loss, and 1.5% bias power.

$$R_{CS} = \frac{V_{CCR} \times N_{PS}}{2I_{OCC} \times n_{XFMR}}$$  \hspace{1cm} (15)

The primary transformer inductance can be calculated using the standard energy storage equation for flyback transformers. Primary current, maximum switching frequency and output and transformer power losses are included in the equation below. Initially determine transformer primary current.

Primary current is simply the maximum current sense threshold divided by the current sense resistance.

$$I_{PP(\text{max})} = \frac{V_{\text{CST(\text{max})}}}{R_{CS}}$$  \hspace{1cm} (16)

$$L_p = \frac{2(V_{OCV} + V_F + V_{OCBC}) \times I_{OCC}}{n_{XFMR} \times I_{PP(\text{max})}^2 \times f_{\text{MAX}}^2}$$  \hspace{1cm} (17)

The secondary winding to auxiliary winding transformer turns ratio ($N_{AS}$) is determined by the lowest target operating output voltage in constant-current regulation and the VDD UVLO of the UCC28700. There is additional energy supplied to VDD from the transformer leakage inductance energy which allows a lower turns ratio to be used in many designs.

$$N_{AS} = \frac{V_{\text{DD(\text{off})}} + V_{FA}}{V_{OCC} + V_F}$$  \hspace{1cm} (18)
Transformer Parameter Verification

The transformer turns ratio selected affects the MOSFET $V_{DS}$ and secondary rectifier reverse voltage so these should be reviewed. The UCC28700 controller requires a minimum on time of the MOSFET ($T_{ON}$) and minimum $D_{MAG}$ time ($T_{DMAG}$) of the secondary rectifier in the high line, minimum load condition. The selection of $F_{MAX}$, $L_P$ and $R_{CS}$ affects the minimum $T_{ON}$ and $T_{DMAG}$.

The secondary rectifier and MOSFET voltage stress can be determined by the equations below.

$$V_{REV} = \frac{V_{IN(max)} \times \sqrt{2}}{N_{PS}} + V_{OCV} + V_{OCBC}$$ \hspace{1cm} (19)

For the MOSFET $V_{DS}$ voltage stress, an estimated leakage inductance voltage spike ($V_{LK}$) needs to be included.

$$V_{DSPK} = \left(\frac{V_{IN(max)} \times \sqrt{2}}{N_{PS}} + V_{OCV} + V_F + V_{OCBC}\right) \times N_{PS} + V_{LK}$$ \hspace{1cm} (20)

The following equations are used to determine if the minimum $T_{ON}$ target of 300 ns and minimum $T_{DMAG}$ target of 1.1 $\mu$s is achieved.

$$T_{ON(min)} = \frac{L_P}{V_{IN(max)} \times \sqrt{2}} \times \frac{I_{PP(max)} \times V_{CST(min)}}{V_{CST(max)}}$$ \hspace{1cm} (21)

$$T_{DMAG(min)} = \frac{T_{ON(min)} \times V_{IN(max)} \times \sqrt{2}}{N_{PS} \times (V_{OCV} + V_F)}$$ \hspace{1cm} (22)

Output Capacitance

The output capacitance value is typically determined by the transient response requirement from no-load. For example, in some USB charger applications there is a requirement to maintain a minimum $V_O$ of 4.1 V with a load-step transient of 0 mA to 500 mA. The equation below assumes that the switching frequency can be at the UCC28700 minimum of $f_{SW(min)}$.

$$C_{OUT} = \frac{I_{TRAN} \left( \frac{1}{f_{SW(min)}} + 150 \mu s \right)}{V_{O\Delta}}$$ \hspace{1cm} (23)

Another consideration of the output capacitor(s) is the ripple voltage requirement which is reviewed based on secondary peak current and ESR. A margin of 20% is added to the capacitor ESR requirement in the equation below.

$$R_{ESR} = \frac{V_{RIPPLE} \times 0.8}{I_{PP(max)} \times N_{PS}}$$ \hspace{1cm} (24)
VDD Capacitance, $C_{DD}$

The capacitance on VDD needs to supply the device operating current until the output of the converter reaches the target minimum operating voltage in constant-current regulation. At this time the auxiliary winding can sustain the voltage to the UCC28700. The total output current available to the load and to charge the output capacitors is the constant-current regulation target. The equation below assumes the output current of the flyback is available to charge the output capacitance until the minimum output voltage is achieved. There is an estimated 1 mA of gate-drive current in the equation and 1 V of margin added to VDD.

$$C_{DD} = \frac{(I_{RUN} + 1\text{mA}) \times C_{OUT} \times V_{OCC}}{I_o \times \left(V_{DD(on)} - V_{DD(off)}\right) - 1V}$$  \hspace{1cm} (25)

VDD Start-Up Resistance, $R_{STR}$

Once the VDD capacitance is known, the start-up resistance from $V_{BULK}$ to achieve the turn-on time target can be determined.

$$R_{STR} = \frac{\sqrt{2} \times V_{IN(min)}}{I_{START} + \frac{V_{DD(on)} \times C_{DD}}{T_{STR}}}$$  \hspace{1cm} (26)

VS Resistor Divider, Line Compensation, and Cable Compensation

The VS divider resistors determine the output voltage regulation point of the flyback converter, also the high-side divider resistor ($R_{S1}$) determines the line voltage at which the controller enables continuous DRV operation. $R_{S1}$ is initially determined based on transformer auxiliary to primary turns ratio and desired input voltage operating threshold.

$$R_{S1} = \frac{V_{IN(run)} \times \sqrt{2}}{N_{PA} \times I_{VSL(run)}}$$  \hspace{1cm} (27)

The low-side VS pin resistor is selected based on desired $V_O$ regulation voltage.

$$R_{S2} = \frac{R_{S1} \times V_{VSR}}{N_{AS} \times (V_{OCV} + V_F) - V_{VSR}}$$  \hspace{1cm} (28)

The UCC28700 can maintain tight constant-current regulation over input line by utilizing the line compensation feature. The line compensation resistor ($R_{LC}$) value is determined by current flowing in $R_{S1}$ and expected gate drive and MOSFET turn-off delay. Assume a 50-ns internal delay in the UCC28700.

$$R_{LC} = \frac{K_{LC} \times R_{S1} \times R_{CS} \times T_D \times N_{PA}}{L_p}$$  \hspace{1cm} (29)

On the UCC28700 which has adjustable cable compensation, the resistance for the desired compensation level at the output terminals can be determined using the equation below.

$$R_{CBC} = \frac{V_{CBC(max)} \times 3\text{k}\Omega \times (V_{OCV} + V_F)}{V_{VSR} \times V_{OCBC}} - 28\text{ k}\Omega$$  \hspace{1cm} (30)

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBsolete:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check [http://www.ti.com/productcontent](http://www.ti.com/productcontent) for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Efforts are underway to better integrate information from third parties, TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
**TAPE AND REEL INFORMATION**

### REEL DIMENSIONS

![Reel Dimensions Diagram]

### TAPE DIMENSIONS

- **A0**: Dimension designed to accommodate the component width
- **B0**: Dimension designed to accommodate the component length
- **K0**: Dimension designed to accommodate the component thickness
- **W**: Overall width of the carrier tape
- **P1**: Pitch between successive cavity centers

### TAPE AND REEL INFORMATION

*All dimensions are nominal*

NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Body dimensions do not include mold flash or protrusion. Mold flash and protrusion shall not exceed 0.15 per side.
D. Leads 1, 2, 3 may be wider than leads 4, 5, 6 for package orientation.
E. Falls within JEDEC MO-178 Variation A8, except minimum lead width.
NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
D. Publication IPC-7351 is recommended for alternate designs.
E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.
IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46C and to discontinue any product or service per JESD48B. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as “components”) are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers’ products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI’s goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or “enhanced plastic” are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have not been so designated is solely at the Buyer’s risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components which meet ISO/TS16949 requirements, mainly for automotive use. Components which have not been so designated are neither designed nor intended for automotive use; and TI will not be responsible for any failure of such components to meet such requirements.
